ADC3581, ADC3582, ADC3583
SBAS873A – FEBRUARY 2021 – REVISED OCTOBER 2022

ADC358x 18-bit 0.5 MSPS to 65 MSPS Low Noise Ultra-low Power ADC

1 Features

- 18-bit 10/25/65 MSPS ADC
- Noise Floor: -160 dBFS/Hz
- Ultra Low Power with Optimized Power Scaling: 77 mW (10 MSPS) to 119 mW (65 MSPS)
- Latency: 1 clock cycle (1-wire SLVDS)
- Specified 18-bit, no missing codes
- INL/DNL: ±7/ ±0.7 LSB (typ)
- Reference: External or Internal
- Input Bandwidth: 900 MHz (3dB)
- Industrial Temperature Range: -40 to +105°C
- On-chip digital filter (optional)
  - Decimation by 2, 4, 8, 16, 32
  - 32-bit NCO
- Serial LVDS digital interface (2-, 1- and 1/2-wire)
- Small Footprint: 40-WQFN (5x5 mm) Package
- Spectral Performance (f_{IN} = 1 MHz):
  - SNR: 84.5 dBFS
  - SFDR: 95 dBc HD2, HD3
  - SFDR: 100 dBFS Worst Spur
- Spectral Performance (f_{IN} = 20 MHz):
  - SNR: 83.5 dBFS
  - SFDR: 90 dBc HD2, HD3
  - SFDR: 95 dBFS Worst Spur

2 Applications

- High-Speed Data Acquisition
- Industrial Monitoring
- Software Defined Radio
- Power Quality Analyzer
- Source Measurement Unit (SMU)
- Communications Infrastructure
- Spectrum Analyzer
- Control Loops
- Instrumentation
- Imaging
- Spectroscopy
- Radar
- Sonar

3 Description

The ADC358x is a low noise, ultra-low power 18-bit 65 MSPS high-speed ADC family. Designed for low noise performance, it delivers a noise spectral density of -160 dBFS/Hz combined with excellent linearity and dynamic range. The ADC358x offers very good DC precision together with IF sampling support which makes it suited for a wide range of applications. High-speed control loops benefit from the short latency as low as only 1 clock cycle. The ADC consumes only 119 mW at 65 Msps and its power consumption scales well with lower sampling rates.

The ADC358x uses a serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports a one-lane and two-lane option. The ADC358x is a pin to pin compatible family with different speed grades. It comes in a 40-pin QFN package (5 x 5 mm) and supports the extended industrial temperature range from -40 to +105ºC.
Package Information

PART NUMBER	PACKAGE[1]	BODY SIZE (NOM)
ADC3583 ADC3582 ADC3581	WQFN (40)	5.00 mm x 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Device Comparison

PART NUMBER	RESOLUTION	SAMPLING RATE
ADC3583	18 BIT	65 MSPS
ADC3582	18 BIT	25 MSPS
ADC3581	18 BIT	10 MSPS

SNR = 84.0 dBFS
SFDR = 90 dBc
Non HD23 = 100 dBFS

FFT: Fs = 65 MSPS, Fin = 5 MHz

5 Pin Configuration and Functions
Figure 5-1. RSB Package, 40-Pin WQFN, Top View

Table 5-1. Pin Descriptions

PIN		I/O	Description
Name	No.		
INPUT/REFERENCE			
AINP	12	I	Positive analog input, channel A
AINM	13	I	Negative analog input, channel A
VCM	8	O	Common-mode voltage output for the analog inputs, 0.95 V
VREF	2	I	External voltage reference input, 1.6 V
REFBUF	4	I	1.2 V external voltage reference input for use with internal reference buffer. Internal 100 kΩ pull-up resistor to AVDD. This pin is also used to configure default operating conditions.
REFGND	3	I	Reference ground input, 0 V
CLOCK			
CLKP	6	I	Positive differential sampling clock input for the ADC
CLKM	7	I	Negative differential sampling clock input for the ADC
CONFIGURATION			
PDN/SYNC	1	I	Power down/Synchronization input. This pin can be configured via the SPI interface. Active high. This pin has an internal 21 kΩ pull-down resistor.
RESET	9	I	Hardware reset. Active high. This pin has an internal 21 kΩ pull-down resistor.
SEN	16	I	Serial interface enable. Active low. This pin has an internal 21 kΩ pull-up resistor to AVDD.
SCLK	35	I	Serial interface clock input. This pin has an internal 21 kΩ pull-down resistor.

Table 5-1. Pin Descriptions (continued)

PIN Name	PIN No.	I/O	Description
SDIO	10	I/O	Serial interface data input and output. This pin has an internal 21 kΩ pull-down resistor.
NC	27,38,39	-	Do not connect
DIGITAL INTERFACE			
DA0P	20	O	Positive differential serial LVDS output for lane 0, channel A.
DA0M	19	O	Negative differential serial LVDS output for lane 0, channel A.
DA1P	18	O	Positive differential serial LVDS output for lane 1, channel A.
DA1M	17	O	Negative differential serial LVDS output for lane 1, channel A.
DB0P	31	O	Positive differential serial LVDS output for lane 0, channel B. Used only in dual band complex decimation. Default is powered down.
DB0M	32	O	Negative differential serial LVDS output for lane 0, channel B. Used only in dual band complex decimation. Default is powered down.
DB1P	33	O	Positive differential serial LVDS output for lane 1, channel B. Used only in dual band complex decimation. Default is powered down.
DB1M	34	O	Negative differential serial LVDS output for lane 1, channel B. Used only in dual band complex decimation. Default is powered down.
DCLKP	23	O	Positive differential serial LVDS bit clock output.
DCLKM	22	O	Negative differential serial LVDS bit clock output.
FCLKP	28	O	Positive differential serial LVDS frame clock output.
FCLKM	29	O	Negative differential serial LVDS frame clock output.
DCLKINP	25	I	Positive differential serial LVDS bit clock input. Internal 100 Ω differential termination.
DCLKINM	24	I	Negative differential serial LVDS bit clock input. Internal 100 Ω differential termination.
POWER SUPPLY			
AVDD	5,15,36	I	Analog 1.8 V power supply
GND	11,14,37,40, PowerPad	I	Ground, 0 V
IOVDD	21,30	I	1.8 V power supply for digital interface
IOGND	26	I	Ground, 0 V for digital interface

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage range, AVDD, IOVDD		−0.3	2.1	V
Supply voltage range, GND, IOGND, REFGND		−0.3	0.3	V
Voltage applied to input pins	AINP/M, CLKP/M, VREF, REFBUF	−0.3	MIN(2.1, AVDD+0.3)	V
	PDN/SYNC, RESET, SCLK, SEN, SDIO	−0.3	MIN(2.1, AVDD+0.3)	
	DCLKINP/M	−0.3	MIN(2.1, IOVDD+0.3)	
Junction temperature, T_J			105	°C
Storage temperature, T_{stg}		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2]	1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD[1]	1.75	1.8	1.85	V
	IOVDD[1]	1.75	1.8	1.85	V
T_A	Operating free-air temperature	−40		105	°C
T_J	Operating junction temperature			105[2]	°C

(1) Measured to GND.
(2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

6.4 Thermal Information

THERMAL METRIC[1]		ADC358x	UNIT
		RSB (QFN)	
		40 Pins	
$R_{\Theta JA}$	Junction-to-ambient thermal resistance	30.7	°C/W
$R_{\Theta JC(top)}$	Junction-to-case (top) thermal resistance	16.4	°C/W
$R_{\Theta JB}$	Junction-to-board thermal resistance	10.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.5	°C/W
$R_{\Theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.0	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics - Power Consumption

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 65 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, external 1.6 V reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ADC3581: 10 MSPS						
I_{AVDD}	Analog supply current	External reference		18	27	mA
I_{IOVDD}	I/O supply current	SLVDS 1-wire		25	43	
P_{DIS}	Power dissipation	External reference, 1-wire		77	126	mW
I_{IOVDD}	I/O supply current	1-wire, 1/2-swing		19		mA
		2-wire		29		
		4x real decimation, 1-wire		26		
ADC3582: 25 MSPS						
I_{AVDD}	Analog supply current	External reference		20	27	mA
I_{IOVDD}	I/O supply current	SLVDS 1-wire		27	43	
P_{DIS}	Power dissipation	External reference, 1-wire		85	126	mW
I_{IOVDD}	I/O supply current	SLVDS 1-wire, 1/2-swing		21		mA
		SLVDS 2-wire		22		
		4x real decimation, 1-wire		23		
ADC3583: 65 MSPS						
I_{AVDD}	Analog supply current	External reference		40	53	mA
I_{IOVDD}	I/O supply current	SLVDS 2-wire		28	43	
P_{DIS}	Power dissipation	External reference, 2-wire		122	173	mW
I_{IOVDD}	I/O supply current	2-wire, 1/2-swing		21		mA
		4x real decimation, 1-wire		29		
		16x real decimation, 1-wire		26		
		4x complex decimation, 1-wire		32		
		16x complex decimation, 1-wire		28		
MISCELLANEOUS						
I_{AVDD}	Internal reference, additional analog supply current			3		mA
	External 1.2V reference (REFBUF), additional analog supply current			0.3		
	Single ended clock input, reduces analog supply current by	Enabled via SPI		0.7		
P_{DIS}	Power consumption in global power down mode	Default mask settings, internal reference		5		mW
		Default mask settings, external reference		9

8 Detailed Description

8.1 Overview

The ADC358x is a low noise, ultra-low power 18-bit high-speed ADC family supporting sampling rates up to 65 MSPS. It offers very good DC precision together with IF sampling support which makes it ideally suited for a wide range of applications. The ADC358x is equipped with an internal reference option but it also supports the use of an external, high precision 1.6 V voltage reference or an external 1.2 V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after only one to two clock cycles.

An optional programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation. The internal DDC mux enables use of two decimation filters with independent NCOs for dual band support (using channel B output interface).

The ADC358x uses a serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports a two-lane (2-wire), a one-lane (1-wire) and a half-lane (1/2-wire) option. The ADC358x includes a digital output formatter which supports output resolutions from 14 to 20-bit.

The device features and control options can be set up either through pin configurations or via SPI register writes.

8.3 Feature Description

8.3.1 Analog Input

The analog inputs of ADC358x are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95 V which must be provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in Figure 8-1. All four sampling switches, on-resistance shown in red are in same position (open or closed) simultaneously.
Figure 8-1. Equivalent input network

8.3.1.1 Analog Input Bandwidth

Figure 8-2 shows the analog full power input bandwidth of the ADC358x with a 50 Ω differential termination. The -3 dB bandwidth is approximately 900 MHz and the useful input bandwidth with good AC performance is approximately 120 MHz.

The equivalent differential input resistance R_{IN} and input capacitance C_{IN} vs frequency are shown in Figure 8-3.

Figure 8-2. ADC Analog Input bandwidth response

Figure 8-3. Equivant R_{IN}, C_{IN} vs Input Frequency
8.3.1.2 Analog Front End Design

The ADC358x is an unbuffered ADC and thus a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network may be needed. Additionally a passive DC bias circuit is needed in AC-coupled applications which can be combined with the termination network.

8.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency and therefore the following filter designs are recommended for different input frequency ranges as shown in Figure 8-4 and Figure 8-5.
Figure 8-4. Sampling glitch filter example for input frequencies from DC to 30 MHz
Figure 8-5. Sampling glitch filter example for input frequencies from 30 to 70 MHz

8.3.1.2.2 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

8.3.1.2.2.1 AC-Coupling

The ADC358x requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in Figure 8-6. The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance can be adjusted to optimize the amplifier performance.
Figure 8-6. AC-Coupling: termination network provides DC bias (glitch filter example for DC - 30 MHz)

8.3.1.2.2.2 DC-Coupling

In DC coupled applications the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in Figure 8-7. The glitch filter in this case is located between the anti-alias filter and the ADC. No termination may be needed if amplifier is located close to the ADC or if the termination is part of the anti-alias filter.
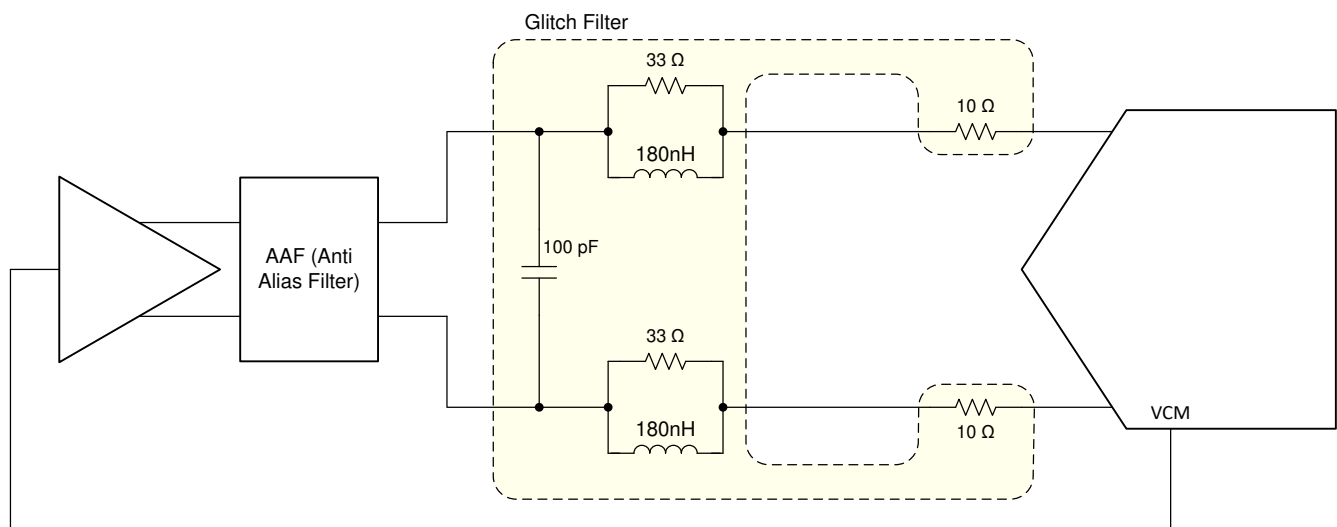

Figure 8-7. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 30 MHz)

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.3.1.3 Auto-Zero Feature

The ADC358x includes an internal auto-zero front end amplifier circuit which improves the 1/f flicker noise. This auto-zero feature is enabled by default for the ADC3581/2 and can be enabled using SPI register writes for the ADC3583 (register 0x11, D0). The 4M point FFTs below show the autozero feature enabled vs disabled.

Figure 8-13. F_S = 65 MSPS, F_{IN} = 5 MHz

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.3.2 Clock Input

In order to maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications (Figure 8-14 and Figure 8-15). For less jitter sensitive applications, the ADC358x provides the option to operate with single ended signaling which saves additional power consumption.

Figure 8-14. AC Performance vs Clock Amplitude (Differential Clock Input)

Figure 8-15. AC Performance vs Clock Amplitude (Single Ended Clock Input)
8.3.2.1 Single Ended vs Differential Clock Input

The ADC358x can be operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input can be AC coupled externally. The ADC358x provides internal bias.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF pin. In this mode there is no internal clock biasing and thus the clock input needs to be DC coupled around a 0.9V center. The unused input needs to be AC coupled to ground.
Figure 8-16. External and internal connection using differential (left) and single ended (right) clock input

8.3.2.2 Signal Acquisition Time Adjust

The ADC358x includes a register (DLL PDN (0x11, D2) which increases the signal acquisition time window for clock rates below 40 MSPS from 25% to 50% of the clock period. Increasing the sampling time provides a longer time for the driving amplifier to settle out the signal which can improve the SNR performance of the system. This register should only be used for the 65 MSPS speed grade (ADC3583) For the 10 and 25 MSPS device speed grades the sampling time is already set to $T_S/2$. When powering down the DLL, the acquisition time will track the clock duty cycle (50% is recommended).

Table 8-1. Acquisition time vs DLL PDN setting

SAMPLING CLOCK F_S (MSPS)	DLL PDN (0x11, D2)	ACQUISITION TIME (t_{ACQ})
65	0	$T_S / 4$
≤ 40	1	$T_S / 2$

8.3.3 Voltage Reference

The ADC358x provides three different options for supplying the voltage reference to the ADC. An external 1.6 V reference can be directly connected to the VREF input; a voltage 1.2 V reference can be connected to the REFBUF input using the internal gain buffer or the internal 1.2 V reference can be enabled to generate a 1.6 V reference voltage. For best performance, the reference noise should be filtered by connecting a 10 uF and a 0.1 uF ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC358x is shown in Figure 8-17.

Note

The voltage reference mode can be selected using SPI writes or by using the REFBUF pin (default) as a control pin (Section 8.5.1). If the REFBUF pin is not used for configuration, the REFBUF pin should be connected to AVDD (even though the REFBUF pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.
Figure 8-17. Different voltage reference options for ADC358x

8.3.3.1 Internal voltage reference

The 1.6 V reference for the ADC can be generated internal using the on-chip 1.2V bandgap reference along with the internal gain buffer. A 10 uF and a 0.1 uF ceramic bypass capacitor (C_{VREF}) should be connected between the VREF and REFGND pins as close to the pins as possible.
Figure 8-18. Internal reference

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, the VREF input can be directly connected to an external 1.6 V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor (C_{VREF}) connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1mA.

Note: The internal reference is also used for other functions inside the device, therefore the reference amplifier should only be powered down in power down state but not during normal operation.
Figure 8-19. External 1.6 V reference

8.3.3.3 External voltage reference with internal buffer (REFBUF)

The ADC358x is equipped with an on-chip reference buffer that also includes gain to generate the 1.6 V reference voltage from an external 1.2 V reference. A 10 uFand a 0.1 uF ceramic bypass capacitor (C_{VREF}) between the VREF and REFGND pins and a 10 uF and a 0.1 uF ceramic bypass capacitor between the REFBUF and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100 uA.
Figure 8-20. External 1.2V reference using internal reference buffer

8.3.4 Digital Down Converter

The ADC358x includes an optional on-chip digital down conversion (DDC) decimation filter that can be enabled via SPI register settings. It supports complex decimation by 2, 4, 8, 16 and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in Figure 8-21. Furthermore it supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.

Internally the decimation filter calculations are performed with a 20-bit resolution in order to avoid any SNR degradation due to quantization noise limitation. The Section 8.3.5.1 truncates to the selected resolution prior to outputting the data on the digital interface.
Figure 8-21. Internal Digital Decimation Filter

8.3.4.1 DDC MUX for Dual Band Decimation

The ADC358x contains a MUX in front of the digital decimation filters which allows ADC to be connected to two digital down converters (see Figure 8-22). This enables dual band complex decimation. The NCO of each digital down converter can be tuned to an independent frequency across the Nyquist zone as illustrated in the example in Figure 8-23. The second DDC is output using the DB0/1 SLVDS interface.
Figure 8-22. DDC MUX
Figure 8-23. Complex Decimation (by 8) with dual band illustration

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.3.4.2 Digital Filter Operation

The complex decimation operation is illustrated with an example in Figure 8-24. First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz) and the output data rate is decimated by 8 complex - in this example the output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$. During the complex mixing the spectrum (signal and noise) is split into real and complex parts and thus the amplitude is reduced by 6-dB. In order to compensate this loss, there is a 6-dB digital gain option in the decimation filter block that can be enabled via SPI write.
Figure 8-24. Complex decimation illustration

The real decimation operation is illustrated with an example in Figure 8-25. There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated - a decimation of 8 would result in an output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$.

During the real mixing the spectrum (signal and noise) amplitude is reduced by 3-dB. In order to compensate this loss, there is a 3-dB digital gain option in the decimation filter block that can be enabled via SPI write.
Figure 8-25. Real decimation illustration

8.3.4.3 FS/4 Mixing with Real Output

In this mode, the output after complex decimation gets mixed with FS/4 (FS = output data rate in this case). Instead of a complex output with the input signal centered around 0 Hz, the output is transmitted as a real output at twice the data rate and the signal is centered around FS/4 (Fout/4) as illustrated in Figure 8-26.

In this example, complex decimation by 8 is used. The output data is transmitted as a real output with an output rate of Fout = FS'/4 (FS' = ADC sampling rate). The input signal is now centered around FS/4 (Fout/4) or FS'/16.
Figure 8-26. FS/4 Mixing with real output

8.3.4.4 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32-bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:

$e^{j\omega n}$ (default) or $e^{-j\omega n}$

where: frequency (ω) is specified as a signed number by the 32-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to $f_{IN} + f_{NCO}$. The NCO frequency can be tuned from $-F_S/2$ to $+F_S/2$ and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally the ADC358x provides the option via SPI to invert the mixer phase.

The NCO frequency setting is set by the 32-bit register value given and calculated as:

$$\text{NCO frequency} = 0 \text{ to } +F_S/2: \text{NCO} = f_{NCO} \times 2^{32} / F_S \tag{1}$$

$$\text{NCO frequency} = -F_S/2 \text{ to } 0: \text{NCO} = (f_{NCO} + F_S) \times 2^{32} / F_S \tag{2}$$

where:
- NCO = NCO register setting (decimal value)
- f_{NCO} = Desired NCO frequency (MHz)
- F_S = ADC sampling rate (MSPS)

The NCO programming is further illustrated with this example:
- ADC sampling rate F_S = 65 MSPS
- Input signal f_{IN} = 10 MHz
- Desired output frequency f_{OUT} = 0 MHz

For this example there are actually four ways to program the NCO and achieve the desired output frequency as shown in Table 8-2.

Table 8-2. NCO value calculations example

Alias or negative image	f_{NCO}	NCO Value	Mixer Phase	Frequency translation for f_{OUT}
f_{IN} = –10 MHz	f_{NCO} = 10 MHz	660764199	as is	$f_{OUT} = f_{IN} + f_{NCO}$ = –10 MHz +10 MHz = 0 MHz
f_{IN} = 10 MHz	f_{NCO} = –10 MHz	3634203097		$f_{OUT} = f_{IN} + f_{NCO}$ = 10 MHz + (–10 MHz) = 0 MHz
f_{IN} = 10 MHz	f_{NCO} = 10 MHz	660764199	inverted	$f_{OUT} = f_{IN} - f_{NCO}$ = 10 MHz – 10 MHz = 0 MHz
f_{IN} = –10 MHz	f_{NCO} = –10 MHz	3634203097		$f_{OUT} = f_{IN} - f_{NCO}$ = –10 MHz – (–10 MHz) = 0 MHz

8.3.4.5 Decimation Filter

The ADC358x supports complex decimation by 2, 4, 8, 16 and 32 with a stopband rejection of at least 85 dB and a pass-band bandwidth of ~ 80%. Table 8-3 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate F_S. In real decimation mode the output bandwidth is half of the complex bandwidth.

Table 8-3. Decimation Filter Summary and Maximum Available Output Bandwidth

REAL/COMPLEX DECIMATION	DECIMATION SETTING N	OUTPUT RATE	OUTPUT BANDWIDTH	OUTPUT RATE (F_S = 65 MSPS)	OUTPUT BANDWIDTH (F_S = 65 MSPS)
Complex	2	F_S / 2 complex	0.8 × F_S / 2	32.5 MSPS complex	26 MHz
	4	F_S / 4 complex	0.8 × F_S / 4	16.25 MSPS complex	13 MHz
	8	F_S / 8 complex	0.8 × F_S / 8	8.125 MSPS complex	6.5 MHz
	16	F_S / 16 complex	0.8 × F_S / 16	4.0625 MSPS complex	3.25 MHz
	32	F_S / 32 complex	0.8 × F_S / 32	2.03125 MSPS complex	1.625 MHz
Real	2	F_S / 2 real	0.4 × F_S / 2	32.5 MSPS	13 MHz
	4	F_S / 4 real	0.4 × F_S / 4	16.25 MSPS	6.5 MHz
	8	F_S / 8 real	0.4 × F_S / 8	8.125 MSPS	3.25 MHz
	16	F_S / 16 real	0.4 × F_S / 16	4.0625 MSPS	1.625 MHz
	32	F_S / 32 real	0.4 × F_S / 32	2.03125 MSPS	0.8125 MHz

The decimation filter responses are normalized to the ADC sampling clock frequency F_S and illustrated in Figure 8-28 to Figure 8-37. They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in Figure 8-27. The x-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate F_S.

For example, in the divide-by-4 complex setup, the output data rate is F_S / 4 complex with a Nyquist zone of F_S / 8 or 0.125 × F_S. The transition band (colored in blue) is centered around 0.125 × F_S and the alias transition band is centered at 0.375 × F_S. The stop-bands (colored in red), which alias on top of the pass-band, are centered at 0.25 × F_S and 0.5 × F_S. The stop-band attenuation is greater than 85 dB.

8.3.4.6 SYNC

The PDN/SYNC pin can be used to synchronize multiple devices using an external SYNC signal. The PDN/SYNC pin can be configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in Figure 8-38.
Figure 8-38. External SYNC timing diagram

The synchronization signal is only required when using the decimation filter - either using the SPI SYNC register or the PDN/SYNC pin. It resets internal clock dividers used in the decimation filter and aligns the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given the internal clock dividers will not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).

When trying to resynchronize during operation, the SYNC toggle should occur at 64*K clock cycles, where K is an integer. This ensures phase continuity of the clock divider.

8.3.4.7 Output Formatting with Decimation

When using decimation, the digital output data is formatted as shown in Figure 8-39 (complex decimation) and Figure 8-40 (real decimation).The output format is illustrated for 18-bit output resolution.
Figure 8-39. Output Data Format in Complex Decimation (18-bit Output Resolution)

Table 8-4 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and complex decimation setting (N).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 18-bit output resolution and complex decimation by 4.

Table 8-4. Serial LVDS Lane Rate Examples with Complex Decimation and 18-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DA/B0,1
N	F_S	R	L	F_S / N	[DA/B0,1] / 2	F_S x 2 x R / L / N
4	65 MSPS	18	2	16.25 MHz	146.25 MHz	292.5 MHz
			1		292.5 MHz	585 MHz
	55 MSPS		1/2	13.75 MHz	495 MHz	990 MHz

Product Folder Links: *ADC3581 ADC3582 ADC3583*
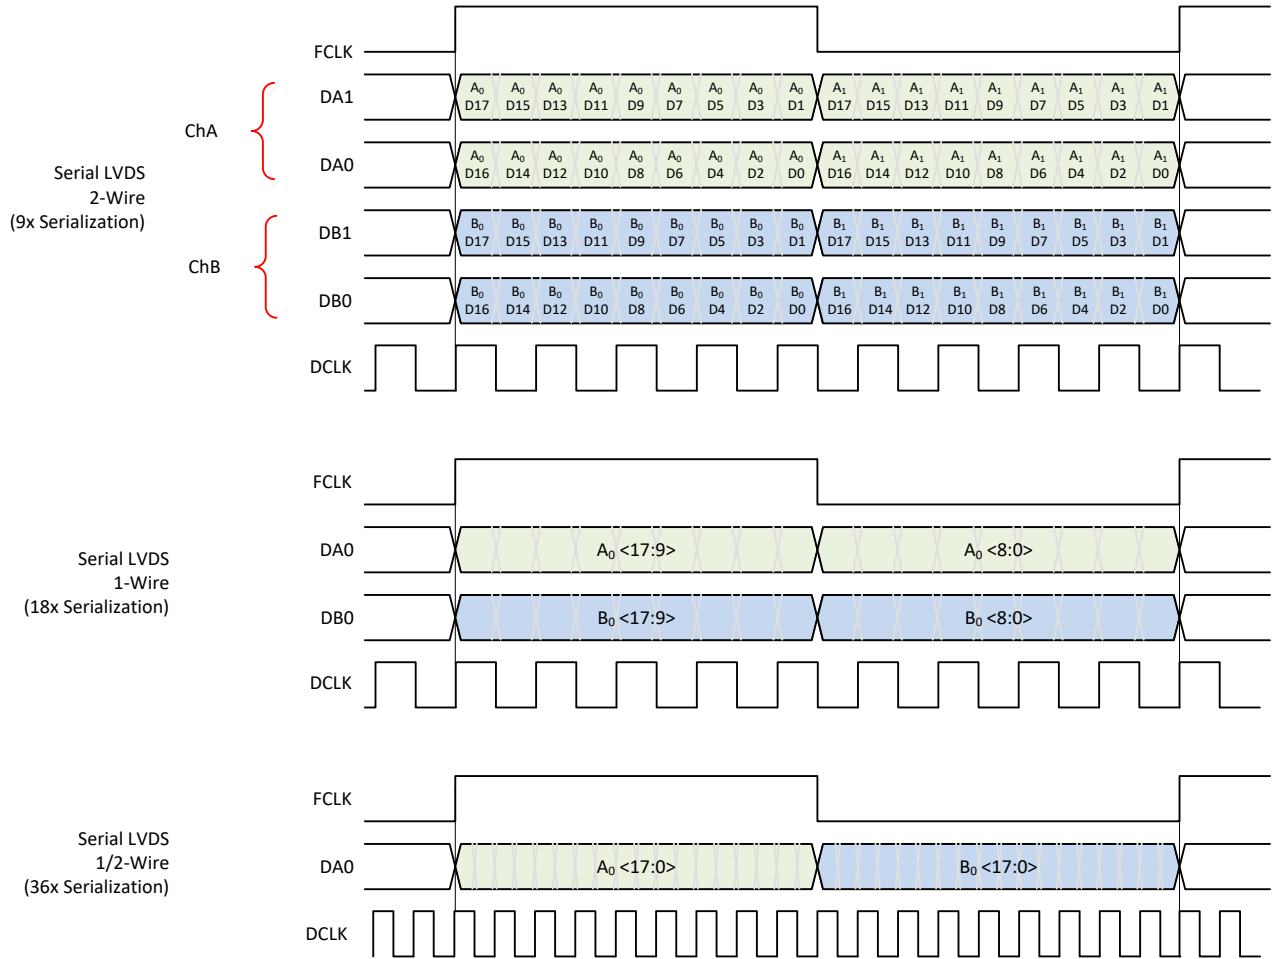

Figure 8-40. Output Data Format in Real Decimation (18-bit Output Resolution)

Table 8-5 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and real decimation setting (M).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 18-bit output resolution and real decimation by 4.

Table 8-5. Serial LVDS Lane Rate Examples with Real Decimation and 18-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DA/B0,1
M	F_S	R	L	F_S / M / 2 (L = 2) F_S / M (L = 1, 1/2)	[DA/B0,1] / 2	F_S x R / L / M
4	65 MSPS	18	2	8.125 MHz	73.125 MHz	146.25 MHz
			1	16.25 MHz	146.25 MHz	292.5 MHz
			1/2		292.5 MHz	585 MHz

Product Folder Links: ADC3581 ADC3582 ADC3583

8.3.5 Digital Interface

The serial LVDS interface supports the data output with 2-wire, 1-wire and 1/2-wire operation. The actual data output rate depends on the output resolution and number of lanes used.

The ADC358x requires an external serial LVDS clock input (DCLKIN), which is used to transmit the data out of the ADC along with the data clock (DCLK). The phase relationship between DCLKIN and the sampling clock is irrelevant but both clocks need to be frequency locked. The SLVDS interface is configured using SPI register writes.

8.3.5.1 Output Formatter

The digital output interface utilizes a flexible output bit mapper as shown in Figure 8-41. The bit mapper takes the 18-bit output directly from the ADC or from the digital decimation filter block and reformats it to a resolution of 14,16,18 or 20-bit. The output serialization factor gets adjusted accordingly for 2-, 1- and 1/2-wire interface modes. The maximum SLVDS interface output data rate can not be exceeded independent of output resolution or serialization factor.

For 14 and 16-bit output resolution the LSBs is truncated during the reformatting. With 20-bit output, in bypass mode two 0s are added in place of the two LSBs while in decimation mode and the digital averaging mode the full 20-bit output is used.
Figure 8-41. Interface output bit mapper

Table 8-6 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note that the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example results in DCLKIN = F_S * 4 instead of * 4.5.

Table 8-6. Serialization factor vs output resolution for different output modes

OUTPUT RESOLUTION	Interface	SERIALIZATION	FCLK	DCLKIN	DCLK	D0/D1
14-bit	2-Wire	7x	$F_S/2$	F_S* 3.5	F_S* 3.5	F_S* 7
	1-Wire	14x	F_S	F_S* 7	F_S* 7	F_S* 14
	1/2-Wire	28x	F_S	F_S* 14	F_S* 14	F_S* 28
16-bit	2-Wire	8x	$F_S/2$	F_S* 4	F_S* 4	F_S* 8
	1-Wire	16x	F_S	F_S* 8	F_S* 8	F_S* 16
	1/2-Wire	32x	F_S	F_S* 16	F_S* 16	F_S* 32
18-bit (default)	2-Wire	9x	$F_S/2$	F_S* 4.5	F_S* 4.5	F_S* 9
	1-Wire	18x	F_S	F_S* 9	F_S* 9	F_S* 18
	1/2-Wire	36x	F_S	F_S* 18	F_S* 18	F_S* 36
20-bit	2-Wire	10x	$F_S/2$	F_S* 5	F_S* 5	F_S* 10
	1-Wire	20x	F_S	F_S* 10	F_S* 10	F_S* 20
	1/2-Wire	40x	F_S	F_S* 20	F_S* 20	F_S* 40

The programming sequence to change the output interface and/or resolution from default settings is shown in Section 8.3.5.4.

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.3.5.2 Output Scrambler

The device includes an optional output scrambler feature. Scrambling is performed on each serial output lane independently. When enabled, the serial output bit stream is scrambled where each output bit is XOR-ed with 2 previous bits (k-14 and k-15) as shown in Figure 8-42. For descrambling, note that the output bit mapper is located after the scrambler.

On the external receiver, the incoming serial data stream can be descrambled by XOR-ing each incoming bit with 2 previous bits (k-14 and k-15).
Figure 8-42. Output scrambling per lane
Figure 8-43. Output scrambler and descrambler operation

Scrambling is enabled by disabling digital bypass (register 0x24, D2) and enabling scrambling (register 0x22, D6).

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.3.5.3 Output Bit Mapper

The output bit mapper allows change to the output bit order for any selected interface mode.
Figure 8-44. Output Bit Mapper

This is a two step process to change the output bit mapping and assemble the output data bus:

1. Both output channel A and B can have up to 20-bit output. Each output bit of either channel has a unique identifier bit as shown in Table 8-7. The MSB starts with bit D19, depending on output resolution chosen the LSB, is D6 (14-bit) to D0 (20-bit). The *previous sample* is only needed in 2-w mode.
2. The bit mapper is then used to assemble the output sample. The following sections detail how to remap the serial output format.

Table 8-7. Unique identifier of each data bit

Bit	Channel A		Channel B (only in dual band DDC)	
	Previous sample (2w only)	Current sample	Previous sample (2w only)	Current sample
D19 (MSB)	0x2D	0x6D	0x29	0x69
D18	0x2C	0x6C	0x28	0x68
D17	0x27	0x67	0x23	0x63
D16	0x26	0x66	0x22	0x62
D15	0x25	0x65	0x21	0x61
D14	0x24	0x64	0x20	0x60
D13	0x1F	0x5F	0x1B	0x5B
D12	0x1E	0x5E	0x1A	0x5A
D11	0x1D	0x5D	0x19	0x59
D10	0x1C	0x5C	0x18	0x58
D9	0x17	0x57	0x13	0x53
D8	0x16	0x56	0x12	0x52
D7	0x15	0x55	0x11	0x51
D6	0x14	0x54	0x10	0x50
D5	0x0F	0x4F	0x0B	0x4B
D4	0x0E	0x4E	0x0A	0x4A
D3	0x0D	0x4D	0x09	0x49
D2	0x0C	0x4C	0x08	0x48
D1	0x07	0x47	0x03	0x43
D0 (LSB)	0x06	0x46	0x02	0x42

In the serial output mode, a data bit (with unique identifier) needs to be assigned to each location within the serial output stream. There are a total of 40 addresses available per channel. Channel A spans from address 0x39 to 0x60 and channel B from address 0x61 to 0x88. When using complex decimation, the output bit mapper is applied to both the "I" and the "Q" sample.

2-wire mode: in this mode, both the current and the previous sample must be used in the address space as shown in Figure 8-45. The address order is different for 14/18-bit and 16/20-bit. Note: there are unused addresses between samples for resolution less than 20-bit (grey back ground), which can be skipped if not used.
Figure 8-45. 2-wire output bit mapper

In the following example (Figure 8-46), the 16-bit 2-wire serial output is reordered to where lane DA1/DB1 carries the 8 MSB and lane DA0/DB0 carries 8 LSBs.
Figure 8-46. Example: 2-wire output bit mapping

1-wire mode: Only the 'current' sample needs to programmed in the address space. A duplicated can be created on DA1/DB1 as well (using addresses shown below) in order to have a redundant output. Lane DA1/DB1 must be powered up.

Figure 8-47. 1-wire output bit mapping

½-wire mode: The output is only lane DA0 and the sample order is programmed into the 40 addresses of chA (from 0x39 to 0x60). This covers 2 samples (one for chA, one for chB) as shown below. If desired, a duplicated on DB0 can be created as well (using addresses shown Figure 8-48) to have a redundant output. Lane DB0 must be powered up.
Figure 8-48. 1/2-wire output bit mapping

8.3.5.4 Output Interface/Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

Table 8-8. Configuration steps for changing interface or decimation

STEP	FEATURE	ADDRESS	DESCRIPTION			
1	Output Interface	0x07	Select the output interface bit mapping depending on resolution and output interface.			
			Output Resolution	2-wire	1-wire	1/2-wire
			14-bit	0x2B	0x6C	0x8D
			16-bit	0x4B		
			18-bit	0x2B		
			20-bit	0x4B		
2		0x13	Load the output interface bit mapping using the E-fuse loader (0x13, D0). Program register 0x13 to 0x01, wait ~ 1ms so that bit mapping is loaded properly followed by 0x13 0x00			
3		0x19	Configure the FCLK frequency based on bypass/decimation and number of lanes used.			
			Bypass/Dec	SLVDS	FCLK SRC (D7)	FCLK DIV (D4)	TOG FCLK (D0)
			Bypass/ Real Decimation	2-wire	0	1	0
				1-wire	0	0	0
				1/2-wire	0	0	0
			Complex Decimation	2-wire	1	0	0
				1-wire	1	0	0
				1/2-wire	0	0	1
4		0x1B	Select the output interface resolution using the bit mapper (D5-D3).			
5		0x20 0x21 0x22	Select the FCLK pattern for decimation for proper duty cycle output of the frame clock.			
				Output Resolution	2-wire	1-wire	1/2-wire
			Real Decimation	14-bit	use default	0xFE000	use default
				16-bit		0xFF000	
				18-bit		0xFF800	
				20-bit		0xFFC00	
			Complex Decimation	14-bit	use default	0xFFFFF	0xFFFFF
				16-bit			
				18-bit			
				20-bit			
6		0x39..0x60 0x61..0x88	Change output bit mapping for chA and chB if desired. This works also with the default interface selection.			
7		0x24 0x22	Enable scrambling			
8	Decimation Filter	0x24	Enable the decimation filter			
9		0x25	Configure the decimation filter			
10		0x2A/B/C/D 0x31/2/3/4	Program the NCO frequency for complex decimation (can be skipped for real decimation)			
11		0x27 0x2E	Configure the complex output data stream (set both bits to 0 for real decimation)			
			SLVDS		OP-Order (D4)	Q-Delay (D3)
			2-wire		1	0
			1-wire		0	1
			1/2-wire		1	1
12		0x26	Set the mixer gain and toggle the mixer reset bit to update the NCO frequency.			

8.3.5.4.1 Configuration Example

The following is a step by step programming example to configure the ADC358x to complex decimation by 8 with 1-wire SLVDS and 16-bit output.

1.   0x07 (address) 0x6C (load bit mapper configuration for 16-bit output with 1-wire SLVDS)
2.   0x13 0x01, wait 1 ms, 0x13 0x00 (load e-fuse)
3.   0x19 0x80 (configure FCLK)
4.   0x1B 0x88 (select 16-bit output resolution)
5.   0x20 0xFF, 0x21 0xFF, 0x22 0x0F (configure FCLK pattern)
6.   0x24 0x06 (enable decimation filter)
7.   0x25 0x30 (configure complex decimation by 8)
8.   0x2A/B/C/D and 0x31/32/33/34 (program NCO frequency)
9.   0x27/0x2E 0x08 (configure Q-delay register bit)
10. 0x26 0xAA, 0x26 0x88(set digital mixer gain to 6-dB and toggle the mixer update)

8.3.5.5 Output Data Format

The output data can be configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and 0x92). Table 8-9 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.

Table 8-9. Overview of minimum and maximum output codes vs output resolution for different formatting

RESOLUTION (BIT)	Two's Complement (default)				Offset Binary			
	14	16	18	20	14	16	18	20
$V_{IN,MAX}$	0x1FFF	0x7FFF	0x1FFFF	0x7FFFF	0x3FFF	0xFFFF	0x3FFFF	0xFFFFF
0	0x0000		0x00000		0x2000	0x8000	0x20000	0x80000
$V_{IN,MIN}$	0x2000	0x8000	0x20000	0x80000	0x0000		0x00000	

8.3.6 Test Pattern

In order to enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes (0x14/0x15/0x16). The test pattern generator is located after the decimation filter as shown in Figure 8-49. In decimation mode (real and complex), the test patterns replace the output data of the DDC - however channel A controls the test patterns for both channels.
Figure 8-49. Test Pattern Generator

*   RAMP Pattern: The step size needs to be configured in the CUSTOM PAT register according to the native resolution of the ADC. When selecting a higher output resolution then the additional LSBs will still be 0 in RAMP pattern mode.
    –   00001: 18-bit output resolution
    –   00100: 16-bit output resolution
    –   10000: 14-bit output resolution
*   Custom Pattern: Configured in the CUSTOM PAT register

8.4 Device Functional Modes

8.4.1 Normal Operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 18-bit resolution.

8.4.2 Power Down Options

A global power down mode can be enabled via SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down 21 kΩ resistor on the PDN/SYNC input pin and the pin is active high - so the pin needs to be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable/disable individual blocks directly or via PDN pin mask in order to trade off power consumption vs wake up time as shown in Table 8-10.
Figure 8-50. Power Down Configurations

Table 8-10. Overview of Power Down Options

Function/ Register	PDN via SPI	Mask for Global PDN	Feature - Default	Power Impact	Wake-up time	Comment
ADC	Yes	-	Enabled			ADC is included in Global PDN automatically
Reference gain amplifier	Yes	Yes	Enabled	~ 0.4 mA	~3 us	Should only be powered down in power down state.
Internal 1.2V reference	Yes		External ref	~ 1-3.5 mA	~3 ms	Internal/external reference selection is available through SPI and REFBUF pin.
Clock buffer	Yes		Differential clock	~ 1 mA	n/a	Single ended clock input saves ~ 1mA compared to differential. Some programmability is available through the REFBUF pin.
Output interface drivers	Yes	-	Enabled	varies	n/a	Depending on output interface mode, unused output drivers can be powered down for maximum power savings
Decimation filter	Yes	-	Disabled	see electrical table	n/a	

Product Folder Links: *ADC3581 ADC3582 ADC3583*

8.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI) however it can operate in a default configuration without requiring the SPI interface. Furthermore the power down function as well as internal/external reference configuration is possible via pin control (PDN/SYNC and REFBUF pin).

Note
The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.

After initial power up, the default operating configuration for each device is shown in Table 8-11.

Table 8-11. Default device configuration after power up

FEATURE	ADC3581	ADC3582	ADC3583
Signal Input	Differential		
Auto-zero	Enabled	Enabled	Disabled
Clock Input	Differential		
Reference	External		
Decimation	DDC bypass		
Interface	1-wire	1-wire	2-wire
Output Format	2s complement		

8.5.1 Configuration using PINs only

The ADC voltage reference can be selected using the REFBUF pin. Even though there is an internal 100 kΩ pull-up resistor to AVDD, the REFBUF pin should be set to a voltage externally and not left floating.

When using a voltage divider to set the REFBUF voltage (R1 and R2 in Figure 8-51), resistor values < 5 kΩ should be used.
Figure 8-51. Configuration of external voltage on REFBUF pin

Table 8-12. REFBUF voltage levels control voltage reference selection

REFBUF VOLTAGE	VOLTAGE REFERENCE OPTION	CLOCKING OPTION
> 1.7 V (Default)	External reference	Differential clock input
1.2 V (1.15-1.25V)	External 1.2V input on REFBUF pin using internal gain buffer	Differential clock input
0.5 - 0.7V	Internal reference	Differential clock input
< 0.1V	Internal reference	Single ended clock input

8.5.2 Configuration using the SPI interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

8.5.2.1 Register Write

The internal registers can be programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8-bit data that are latched in on the SCLK rising edges

Figure 8-52 shows the timing requirements for the serial register write operation.
Figure 8-52. Serial Register Write Timing Diagram

8.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
4. The device launches the contents (D[7:0]) of the selected register on the SDIO pin on SCLK falling edge
5. The external controller can capture the contents on the SCLK rising edge
Figure 8-53. Serial Register Read Timing Diagram

8.6.1 Detailed Register Description

Figure 8-54. Register 0x00

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	RESET
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 8-14. Register 0x00 Field Descriptions

Bit	Field	Type	Reset	Description
7-1	0	R/W	0	Must write 0
0	RESET	R/W	0	This bit resets all internal registers to the default values and self clears to 0.

Figure 8-55. Register 0x07

7	6	5	4	3	2	1	0
OP IF MAPPER			0	OP IF EN	OP IF SEL		
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 8-15. Register 0x07 Field Descriptions

Bit	Field	Type	Reset	Description
7-5	OP IF MAPPER	R/W	000	Output interface mapper. This register contains the proper output interface bit mapping for the different interfaces. The interface bit mapping is internally loaded from e-fuses and also requires a fuse load command to go into effect (0x13, D0). Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. After initial reset the default output interface variant is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 001: 2-wire, 18 and 14-bit 010: 2-wire, 16-bit 011: 1-wire 100: 0.5-wire others: not used
4	0	R/W	0	Must write 0
3	OP IF EN	R/W	0	Enables changing the default output interface mode (D2-D0).
2-0	OP IF SEL	R/W	000	Selection of the output interface mode. OP IF EN (D3) needs to be enabled also. After initial reset the default output interface is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 011: 2-wire 100: 1-wire 101: 0.5-wire others: not used

Table 8-19. Register 0x0E Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC PIN EN	R/W	0	This bit controls the functionality of the SYNC/PDN pin. 0: SYNC/PDN pin exercises global power down mode when pin is pulled high. 1: SYNC/PDN pin issues the SYNC command when pin is pulled high.
6	SPI SYNC	R/W	0	Toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0. 0: Normal operation 1: SYNC command issued.
5	SPI SYNC EN	R/W	0	This bit enables synchronization using SPI instead of the SYNC/PDN pin. 0: Synchronization using SPI register bit disabled. 1: Synchronization using SPI register bit enabled.
4	0	R/W	0	Must write 0
3	REF CTL	R/W	0	This bit determines if the REFBUF pin controls the voltage reference selection or the SPI register (D2-D1). 0: The REFBUF pin selects the voltage reference option. 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using D0.
2-1	REF SEL	R/W	00	Selects of the voltage reference option. REF CTRL (D3) must be set to 1. 00: Internal reference 01: External voltage reference (1.2V) using internal reference buffer (REFBUF) 10: External voltage reference 11: not used
0	SE CLK EN	R/W	0	Selects single ended clock input and powers down the differential sampling clock input buffer. REF CRTL (D3) must be set to 1. 0: Differential clock input 1: Single ended clock input

Bit	Field	Type	Reset	Description
7-3	0	R/W	0	Must write 0
2	DLL PDN	R/W	0	This register applies ONLY to the ADC3583. It powers down the internal DLL, which is used to adjust the sampling time. This register must only be enabled when operating at sampling rates below 40 MSPS. When DLL PDN bit is enabled the sampling time is directly dependent on sampling clock duty cycle (with a 50/50 duty the sampling time is $T_S/2$). 0: Sampling time is $T_S/4$ 1: Sampling time is $T_S/2$ (only for sampling rates below 40 MSPS).
1	0	R/W	0	Must write 0
0	AZ EN	R/W	0	This bit enables the internal auto-zero circuitry. It is enabled by default for the ADC3581/82 and disabled for the ADC3583. ADC3581/82: 0: Auto-zero enabled 1: Auto-zero disabled ADC3583: 0: Auto-zero disabled 1: Auto-zero enabled

9 Application Information Disclaimer

> **Note**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Typical Application

A spectrum analyzer is a typical frequency domain application for the ADC358x and its front end circuitry is very similar to several other systems such as software defined radio (SDR), sonar, radar or communications. Some applications require frequency coverage including DC or near DC (such as, sonar), so it is included in this example.

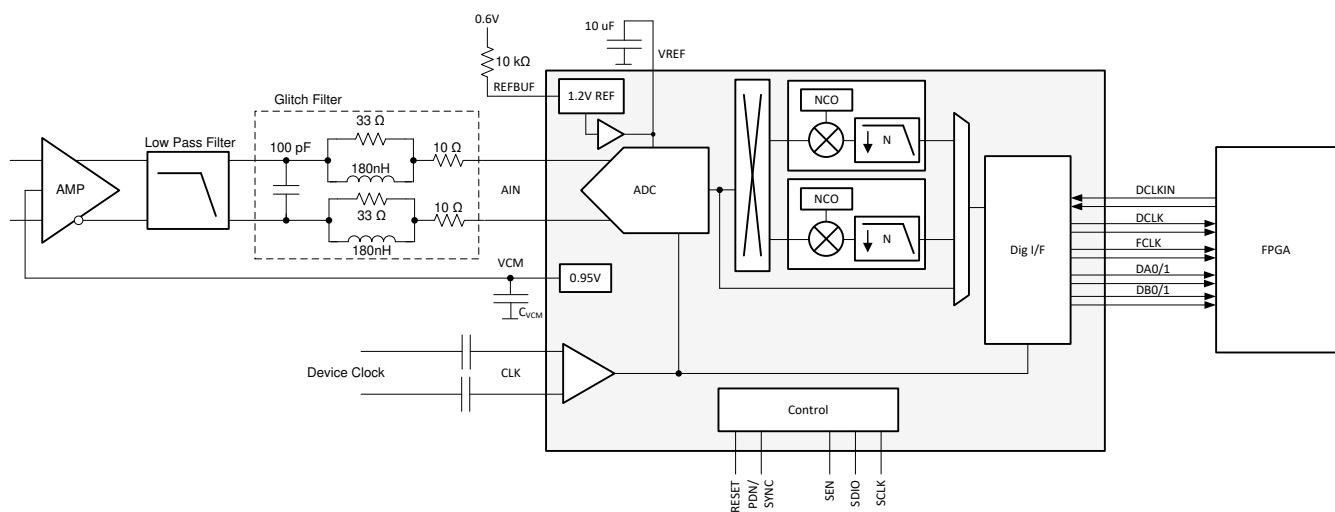

Figure 9-1. Typical configuration for a spectrum analyzer with DC support

9.1.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If very low input frequency is supported then the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed then AC coupling and use of a balun may be more suitable.

The internal reference is used since DC precision is not needed. However the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferers can be present then the ADC SFDR performance will be a key care about as well. A higher ADC sampling rate is desirable in order to relax the external anti-aliasing filter – an internal decimation filter can be used to reduce the digital output rate afterwards.

Table 9-1. Design key care-abouts

FEATURE	DESCRIPTION
Signal Bandwidth	DC to 20 MHz
Input Driver	Single ended to differential signal conversion and DC coupling
Clock Source	External clock with low jitter

When designing the amplifier/filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC358x input full-scale is 3.2 Vpp. When factoring in ~ 1 dB for insertion loss of the filter, then the amplifier needs to deliver close to 3.6 Vpp. The amplifier distortion performance will degrade

with a larger output swing and considering the ADC common mode input voltage the amplifier may not be able to deliver the full swing. The ADC358x provides an output common mode voltage of 0.95 V and the THS4541 for example can only swing within 250 mV of its negative supply. A unipolar 3.3 V amplifier power supply will thus limit the maximum voltage swing to ~ 2.8 Vpp. Hence if a larger output swing is required (factoring in filter insertion loss) then a negative supply for the amplifier is needed in order to eliminate that limitation. Additionally input voltage protection diodes may be needed to protect the ADC from over-voltage events.

Table 9-2. Output voltage swing of THS4541 vs power supply

DEVICE	MIN OUTPUT VOLTAGE	MAX SWING WITH 3.3 V/ 0 V SUPPLY	MAX SWING WITH 3.3 V/ -1.0 V SUPPLY
THS4541	VS- + 250 mV	2.8 Vpp	6.8 Vpp

9.1.2 Detailed Design Procedure

9.1.2.1 Input Signal Path

Depending on desired input signal frequency range the THS4551 and THS4541 provide very good low power options to drive the ADC inputs. Table 9-3 provides a comparison between the THS4551 and THS4541 and the power consumption vs usable frequency trade off.

Table 9-3. Fully Differential Amplifier Options

DEVICE	CURRENT (IQ) PER CHANNEL	USABLE FREQUENCY RANGE
THS4561	0.8 mA	< 3 MHz
THS4551	1.4 mA	< 10 MHz
THS4541	10 mA	< 70 MHz

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to added as well as shown in Section 8.3.1.2.1. In this example the DC - 30 MHz glitch filter is selected.

9.1.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 20 MHz) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (i.e. square wave vs sine wave). Table 9-4 provides an overview of the estimated SNR performance of the ADC358x based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC358x thermal noise of 84.5 dBFS and input signal at -1dBFS.

Table 9-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter

| INPUT FREQUENCY	$T_{J,EXT}$ = 100 fs	$T_{J,EXT}$ = 250 fs	$T_{J,EXT}$ = 500 fs	$T_{J,EXT}$ = 1 ps
5 MHz	84.5	84.4	84.2	83.6
10 MHz	84.3	84.1	83.5	81.7
20 MHz	83.5	83.2	81.5	77.8

Termination of the clock input should be considered for long clock traces.

9.1.2.3 Voltage Reference

The ADC358x is configured to internal reference operation by applying 0.6 V to the REFBUF pin.
9.1.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC3583 operated at 65 MSPS with a full-scale input at -1 dBFS and input frequencies of 5, 10 and 20 MHz.

SNR = 81.5 dBFS, SFDR = 88 dBc, Non HD23 = 95 dBFS

**Figure 9-2. Single Tone FFT at F$_{IN}$ = 5 MHz**

SNR = 80.9 dBFS, SFDR = 91 dBc, Non HD23 = 83 dBFS

Figure 9-3. Single Tone FFT at F$_{IN}$ = 10 MHz

SNR = 77.6 dBFS, SFDR = 76 dBc, Non HD23 = 93 dBFS

Figure 9-4. Single Tone FFT at F$_{IN}$ = 20 MHz

A$_{IN}$ = -10 dBFS, SNR = 81.3 dBFS, SFDR = 87 dBc, Non HD23 = 90 dBFS

Figure 9-5. Single Tone FFT at F$_{IN}$ = 20 MHz

9.2 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 9-6.

1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied the internal bandgap reference will power up and settle out in ~ 2ms.
2. Configure REFBUF pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
4. Begin programming using SPI interface.

Figure 9-6. Initialization of serial registers after power up

Table 9-5. Power-up timing

		MIN	TYP	MAX	UNIT
t_1	Power-on delay: delay from power up to logic level of REFBUF pin	2			ms
t_2	Delay from REFBUF pin logic level to RESET rising edge	100			ns
t_3	RESET pulse width	1			us
t_4	Delay from RESET disable to SEN active	~ 200000			clock cycles

9.2.1 Register Initialization During Operation

If required, the serial interface registers can be cleared and reset to default settings during operation either:

• through a hardware reset or
• by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

After hardware or software reset, the wait time is also ~ 200000 clock cycles before the SPI registers can be programmed.

9.3 Power Supply Recommendations

The ADC358x requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC itself while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.

The AVDD power supply must be low noise in order to achieve data sheet performance. In applications operating near DC, the 1/f noise contribution of the power supply needs to be considered as well. The ADC is designed for very good PSRR which aides with the power supply filter design.
Figure 9-7. Power supply rejection ratio (PSRR) vs frequency

There are two recommended power-supply architectures:

1. 1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
2. 2. Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach provides the best efficiency, but care must be taken to ensure switching noise is minimized to prevent degraded ADC performance.

TI WEBENCH® Power Designer can be used to select and design the individual power-supply elements needed: see the WEBENCH® Power Designer

Recommended switching regulators for the first stage include the TPS62821, and similar devices.

Recommended low dropout (LDO) linear regulators include the TPS7A4701, TPS7A90, LP5901, and similar devices.

For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note the switching frequency reported from WEBENCH® and design the EMI filter and capacitor combination to have the notch frequency centered as needed. Figure 9-8 and Figure 9-9 illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared in order to prevent digital switching noise from coupling into the analog signal chain.
**Figure 9-8. Example: LDO Linear Regulator Approach**

Ripple filter notch frequency to match switching frequency of the DC/DC regulator
FB = Ferrite bead filter

Figure 9-9. Example Switcher-Only Approach

9.4 Layout

9.4.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals
   - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
   - Traces should be routed using loosely coupled 100-Ω differential traces.
   - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.
2. Digital output interface
   - Traces should be routed using tightly coupled 100-Ω differential traces.
3. Voltage reference
   - The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND – on top layer avoiding vias.
   - Depending on configuration an additional bypass capacitor between REFBUF and REFGND may be recommended and should also be placed as close to pins as possible on top layer.
4. Power and ground connections
   - Provide low resistance connection paths to all power and ground pins.
   - Use power and ground planes instead of traces.
   - Avoid narrow, isolated paths which increase the connection resistance.
   - Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

9.4.2 Layout Example

The following screen shot shows the top layer of the ADC358x/368x EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- SLVDS output interface lanes are routed differential and length matched
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

Figure 9-10. Layout example: top layer of ADC358x/368x EVM

10 Device and Documentation Support

10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.5 Glossary

TI Glossary   This glossary lists and explains terms, acronyms, and definitions.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

Reel
Diameter

Reel Width (W1)

TAPE DIMENSIONS

K0 — P1

B0 | W

Cavity — A0

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing
   per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate
design recommendations.
