## Dual High Speed Low Power CAN Transceiver

The NCV7441, dual CAN transceiver offers two fully independent high-speed CAN transceivers which can be individually connected to two CAN protocol controllers. The CAN channels can be separately put to normal or to standby mode, in which remote wakeup detection from the bus is possible.

Due to the shared auxiliary circuitry and common package, this circuit version can replace two standard high-speed CAN transceivers while saving board space.

### Features

- Compatible with the ISO 11898 Standard (ISO 11898-2, ISO 11898-5 and SAE J2284)
- Low Quiescent Current
- High Speed (up to 1 Mbps)
- Ideally Suited for 12 V and 24 V Industrial and Automotive Applications
- Extremely Low Current Standby Mode with Wakeup Via the Bus
- Low EME without Common-mode Choke
- No Disturbance of the Bus Lines with an Un-powered Node
- Predictable Behavior Under All Supply Circumstances
- Transmit Data (TxD) Dominant Time-out Function
- Thermal Protection
- Bus Pins Protected Against Transients in an Automotive Environment
- Power Down Mode in Which the Transmitter is Disabled
- Bus and  $V_{SPLIT}$  Pins Short Circuit Proof to Supply Voltage and Ground
- Input Logic Levels Compatible with 3.3 V Devices
- Up to 110 Nodes can be Connected to the Same Bus in Function of Topology
- Pb-Free Packages are Available

### Typical Applications

- Automotive
- Industrial Networks

## BLOCK DIAGRAM

Figure 1. NCV7441 Dual CAN: Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin Number	Pin Name	Pin Type	Description
1	TxD1	digital input; internal pull-up	transmit data for the 1 <sup>st</sup> CAN channel in normal mode; ignored in standby mode
2	RxD1	digital output	received data from the 1 <sup>st</sup> CAN channel in normal mode; 1 <sup>st</sup> CAN channel remote wakeup indication in standby mode
3	GND	ground	ground connection
4	V <sub>CC</sub>	supply input	5 V supply connection
5	GND	ground	ground connection
6	RxD2	digital output	received data from the 2 <sup>nd</sup> CAN channel; 2 <sup>nd</sup> CAN channel remote wakeup indication in standby mode
7	TxD2	digital input; internal pull-up	transmit data for the 2 <sup>nd</sup> CAN channel
8	STB2	digital input; internal pull-up	mode control input for the 2 <sup>nd</sup> CAN channel; STB2 = High puts the 2 <sup>nd</sup> CAN channel into standby mode
9	CANL2	high-voltage analog input/output	CANL-wire connection of the 2 <sup>nd</sup> CAN channel
10	CANH2	high-voltage analog input/output	CANH-wire connection of the 2 <sup>nd</sup> CAN channel
11	TEST / GND	test/ground	The pin is used for test purposes during device production. It's recommended to connect to ground in the end-application.
12	CANL1	high-voltage analog input/output	CANL-wire connection of the 1 <sup>st</sup> CAN channel
13	CANH1	high-voltage analog input/output	CANH-wire connection of the 1 <sup>st</sup> CAN channel
14	STB1	digital input; internal pull-up	mode control input for the 1 <sup>st</sup> CAN channel; STB1 = High puts the 1 <sup>st</sup> CAN channel into standby mode

## TYPICAL APPLICATION DIAGRAM

PD20100615.03

Figure 2. NCV7441 Dual CAN: Example Application Diagram

### FUNCTIONAL DESCRIPTION

Dual CAN device behaves identically to two independent CAN transceivers. The representative signal dependencies are shown in Figure 4 and further functional description is given in Table 2.

Table 2. FUNCTIONAL DESCRIPTION

V <sub>CC</sub>	STB1/2	TxD1/2	RxD1/2	Transceiver on CANH1/2/CANL1/2	Comment
< V <sub>CC_UV</sub>	X	X	HZ	Deactivated; unbiased	The entire chip in under-voltage
> V <sub>CC_UV</sub>	High	X	Low-power receiver output	Transmitter deactivated; Bus biased to GND through the input circuitry; Receiver monitoring CAN1/2 wakeup	CAN1/2 in standby mode
	Low	High	Indicates the signal received on CAN1/2	Recessive signal transmitted on CAN1/2; Bus biased to V <sub>CC</sub> /2 through the input circuitry	CAN1/2 in normal mode
	Low	Low		Dominant signal transmitted on CAN1/2; Bus biased to V <sub>CC</sub> /2 through the input circuitry	

## NCV7441

If the main power supply  $V_{CC}$  (nominal 5 V) is above its under-voltage ( $V_{CC\_UV}$ ) level, each CAN channel can enter either normal mode (when the corresponding STB1/2 digital input is pulled Low) or standby mode (when the corresponding STB1/2 signal is left High):

- In the normal mode:
  - ◆ The bus transceiver is ready to transmit and receive CAN bus signals with the full CAN communication speed (up to 1 Mbps) and thus interconnect the CAN bus with the corresponding CAN controller through digital pins TxD1/2 and RxD1/2
  - ◆ The bus pins are internally biased to typically  $V_{CC}/2$  through the input circuitry
  - ◆ TxD1/2 input pin is monitored by a timeout in order to prevent a permanent dominant being forced to the bus thus preventing other nodes from communicating. If TxD1/2 is Low for longer than  $t_{cnt(timeout)}$ , the transmitter switches back to recessive. Only when TxD1/2 returns to High, the timeout counter is reset and the transmitter is ready to transmit dominant symbols again. The TxD1/2 timeout protection is implemented individually for both CAN transceivers.
  - ◆ A common thermal monitoring circuit compares the circuit junction temperatures with threshold  $T_{J(sd)}$ . If the thermal shutdown level is exceeded, dominant transmission is disabled. The circuit remains biased and ready to transmit but the logical path from TxD1/2 pin(s) is blocked. The transmission is again enabled when the junction temperature decreases below the shutdown level and the TxD1/2 pin returns to the High level, thus avoiding thermal oscillations.
- In the standby mode:
  - ◆ The respective transmitter is disabled and the current consumption of the channel is fundamentally reduced. Only the low-power receiver on the channel remains active in order to detect potential CAN bus wakeups. The logical signal on TxD1/2 input is ignored.
  - ◆ The bus pins are biased to GND through the input circuitry
  - ◆ Digital output RxD1/2 signals the output of the low-power receiver and can be used as a wakeup signal in the application. A filtering time  $t_{dBUS}$  is applied between the bus activity and the RxD1/2 signal in order to ensure that only sufficiently long dominant signals on the bus will be propagated to the digital output. In addition, dominant bus signals are ignored in case they were present during normal-to-standby mode transition; in this way unwanted wakeups are avoided in case of permanent dominant failure on the bus. Example waveforms illustrating bus activity detection in standby mode are shown in Figure 3.

In order to ensure a safe device state, the digital inputs STB1/2 and TxD1/2 are connected through internal pull-up resistors to  $V_{CC}$  thus ensuring that both channels remain in standby mode and/or no dominant can be transmitted in case any of the digital inputs gets disconnected.
