

## Hardware security module for secure programming

### Features

- Genuine firmware identification (firmware identifier)
- Identification of STM32 products with secure firmware install (SFI) functionality
- Management of ST public keys associated with the supported STM32 products
- License generation using a customer-defined firmware encryption key
- Secure counter that generates a predefined number of licenses
- Direct support for the STM32CubeProgrammer software (STM32CubeProg) including the STM32 Trusted Package Creator tool.

### Description

The **STM32HSM-V1** hardware security module (HSM) is used to secure the programming of STM32 products, and to avoid product counterfeiting at contract manufacturers' premises.

The SFI feature allows secure loading of customer firmware to STM32 products embedding a secure bootloader. For further information on this feature, refer to the AN4992 application note available from [st.com](http://st.com).

After defining the firmware encryption key and encrypting their firmware, the original equipment manufacturer (OEM) stores the encryption key to one or more **STM32HSM-V1** HSMs and sets the number of authorized SFI operations (counter value) using the STM32CubeProgrammer and STM32 Trusted Package Creator software tools. Contract manufacturers must utilize the **STM32HSM-V1** HSMs to load encrypted firmware to STM32 devices: each HSM only allows the OEM-defined number of programming operations before being irreversibly deactivated.

Product summary	
Product version	Maximum counter value
<b>STM32HSM-V1XL</b>	1 000 000
<b>STM32HSM-V1ML</b>	10 000
<b>STM32HSM-V1BE</b>	300
<b>STM32HSM-V1AE</b>	25

## Revision history

**Table 1. Document revision history**

Date	Revision	Changes
06-May-2019	1	Initial release.
10-Oct-2019	2	Updated <a href="#">Product summary</a> .
30-Mar-2021	3	Added reference to AN4992 to <a href="#">Description</a> .
