

# Universal Voltage Monitors

## MC34161, MC33161, NCV33161

The MC34161/MC33161 are universal voltage monitors intended for use in a wide variety of voltage sensing applications. These devices offer the circuit designer an economical solution for positive and negative voltage detection. The circuit consists of two comparator channels each with hysteresis, a unique Mode Select Input for channel programming, a pinned out 2.54 V reference, and two open collector outputs capable of sinking in excess of 10 mA. Each comparator channel can be configured as either inverting or noninverting by the Mode Select Input. This allows over, under, and window detection of positive and negative voltages. The minimum supply voltage needed for these devices to be fully functional is 2.0 V for positive voltage sensing and 4.0 V for negative voltage sensing.

Applications include direct monitoring of positive and negative voltages used in appliance, automotive, consumer, and industrial equipment.

### Features

- Unique Mode Select Input Allows Channel Programming
- Over, Under, and Window Voltage Detection
- Positive and Negative Voltage Detection
- Fully Functional at 2.0 V for Positive Voltage Sensing and 4.0 V for Negative Voltage Sensing
- Pinned Out 2.54 V Reference with Current Limit Protection
- Low Standby Current
- Open Collector Outputs for Enhanced Device Flexibility
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

## MAXIMUM RATINGS (Note 1)

Rating	Symbol	Value	Unit
Power Supply Input Voltage	$V_{CC}$	40	V
Comparator Input Voltage Range	$V_{in}$	- 1.0 to +40	V
Comparator Output Sink Current (Pins 5 and 6) (Note 2)	$I_{Sink}$	20	mA
Comparator Output Voltage	$V_{out}$	40	V
Power Dissipation and Thermal Characteristics (Note 2)			
P Suffix, Plastic Package, Case 626			
Maximum Power Dissipation @ $T_A = 70^\circ\text{C}$	$P_D$	800	mW
Thermal Resistance, Junction-to-Air	$R_{\theta JA}$	100	$^\circ\text{C/W}$
D Suffix, Plastic Package, Case 751			
Maximum Power Dissipation @ $T_A = 70^\circ\text{C}$	$P_D$	450	mW
Thermal Resistance, Junction-to-Air	$R_{\theta JA}$	178	$^\circ\text{C/W}$
DM Suffix, Plastic Package, Case 846A			
Thermal Resistance, Junction-to-Ambient	$R_{\theta JA}$	240	$^\circ\text{C/W}$
Operating Junction Temperature	$T_J$	+150	$^\circ\text{C}$
Operating Ambient Temperature (Note 3)	$T_A$		$^\circ\text{C}$
MC34161		0 to +70	
MC33161		- 40 to +105	
NCV33161		-40 to +125	
Storage Temperature Range	$T_{stg}$	- 55 to +150	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- This device series contains ESD protection and exceeds the following tests:  
Human Body Model 2000 V per MIL-STD-883, Method 3015.  
Machine Model Method 200 V.
- Maximum package power dissipation must be observed.
- $T_{low} = 0^\circ\text{C}$  for MC34161       $T_{high} = +70^\circ\text{C}$  for MC34161  
      $-40^\circ\text{C}$  for MC33161           $+105^\circ\text{C}$  for MC33161

## FUNCTIONAL DESCRIPTION

**Introduction**

To be competitive in today's electronic equipment market, new circuits must be designed to increase system reliability with minimal incremental cost. The circuit designer can take a significant step toward attaining these goals by implementing economical circuitry that continuously monitors critical circuit voltages and provides a fault signal in the event of an out-of-tolerance condition. The MC34161, MC33161 series are universal voltage monitors intended for use in a wide variety of voltage sensing applications. The main objectives of this series was to configure a device that can be used in as many voltage sensing applications as possible while minimizing cost. The flexibility objective is achieved by the utilization of a unique Mode Select input that is used in conjunction with traditional circuit building blocks. The cost objective is achieved by processing the device on a standard Bipolar Analog flow, and by limiting the package to eight pins. The device consists of two comparator channels each with hysteresis, a mode select input for channel programming, a pinned out reference, and two open collector outputs. Each comparator channel can be configured as either inverting or noninverting by the Mode Select input. This allows a single device to perform over, under, and window detection of positive and negative voltages. A detailed description of each section of the device is given below with the representative block diagram shown in Figure 14.

**Input Comparators**

The input comparators of each channel are identical, each having an upper threshold voltage of  $1.27\text{ V} \pm 2.0\%$  with  $25\text{ mV}$  of hysteresis. The hysteresis is provided to enhance output switching by preventing oscillations as the comparator thresholds are crossed. The comparators have an input bias current of  $60\text{ nA}$  at their threshold which approximates a  $21.2\text{ M}\Omega$  resistor to ground. This high impedance minimizes loading of the external voltage divider for well defined trip points. For all positive voltage sensing applications, both comparator channels are fully functional at a  $V_{CC}$  of  $2.0\text{ V}$ . In order to provide enhanced device ruggedness for hostile industrial environments, additional circuitry was designed into the inputs to prevent device latchup as well as to suppress electrostatic discharges (ESD).

**Reference**

The  $2.54\text{ V}$  reference is pinned out to provide a means for the input comparators to sense negative voltages, as well as a means to program the Mode Select input for window detection applications. The reference is capable of sourcing in excess of  $2.0\text{ mA}$  output current and has built-in short circuit protection. The output voltage has a guaranteed tolerance of  $\pm 2.4\%$  at room temperature.

The  $2.54\text{ V}$  reference is derived by gaining up the internal  $1.27\text{ V}$  reference by a factor of two. With a power supply voltage of  $4.0\text{ V}$ , the  $2.54\text{ V}$  reference is in full regulation, allowing the device to accurately sense negative voltages.

**Mode Select Circuit**

The key feature that allows this device to be flexible is the Mode Select input. This input allows the user to program each of the channels for various types of voltage sensing applications. Figure 15 shows that the Mode Select input has three defined states. These states determine whether Channel 1 and/or Channel 2 operate in the inverting or noninverting mode. The Mode Select thresholds are shown in Figure 6. The input circuitry forms a tristate switch with thresholds at  $0.63\text{ V}$  and  $V_{ref} + 0.23\text{ V}$ . The mode select input current is  $10\text{ }\mu\text{A}$  when connected to the reference output, and  $42\text{ }\mu\text{A}$  when connected to a  $V_{CC}$  of  $5.0\text{ V}$ , refer to Figure 7.

**Output Stage**

The output stage uses a positive feedback base boost circuit for enhanced sink saturation, while maintaining a relatively low device standby current. Figure 11 shows that the sink saturation voltage is about  $0.2\text{ V}$  at  $8.0\text{ mA}$  over temperature. By combining the low output saturation characteristics with low voltage comparator operation, this device is capable of sensing positive voltages at a  $V_{CC}$  of  $1.0\text{ V}$ . These characteristics are important in undervoltage sensing applications where the output must stay in a low state as  $V_{CC}$  approaches ground. Figure 5 shows the Output Voltage versus Supply Voltage in an undervoltage sensing application. Note that as  $V_{CC}$  drops below the programmed  $4.5\text{ V}$  trip point, the output stays in a well defined active low state until  $V_{CC}$  drops below  $1.0\text{ V}$ .

## APPLICATIONS

The following circuit figures illustrate the flexibility of this device. Included are voltage sensing applications for over, under, and window detectors, as well as three unique configurations. Many of the voltage detection circuits are shown with the open collector outputs of each channel connected together driving a light emitting diode (LED). This 'ORed' connection is shown for ease of explanation and it is only required for window detection applications.

Note that many of the voltage detection circuits are shown with a dashed line output connection. This connection gives the inverse function of the solid line connection. For example, the solid line output connection of Figure 16 has the LED 'ON' when input voltage  $V_S$  is above trip voltage  $V_2$ , for overvoltage detection. The dashed line output connection has the LED 'ON' when  $V_S$  is below trip voltage  $V_2$ , for undervoltage detection.

# MC34161, MC33161, NCV33161

The above figure shows the MC34161 configured as a dual positive overvoltage detector. As the input voltage increases from ground, the LED will turn 'ON' when  $V_{S1}$  or  $V_{S2}$  exceeds  $V_2$ . With the dashed line output connection, the circuit becomes a dual positive undervoltage detector. As the input voltage decreases from the peak towards ground, the LED will turn 'ON' when  $V_{S1}$  or  $V_{S2}$  falls below  $V_1$ .

For known resistor values, the voltage trip points are:

$$V_1 = (V_{th} - V_H) \left( \frac{R_2}{R_1} + 1 \right) \quad V_2 = V_{th} \left( \frac{R_2}{R_1} + 1 \right)$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_2}{R_1} = \frac{V_1}{V_{th} - V_H} - 1 \quad \frac{R_2}{R_1} = \frac{V_2}{V_{th}} - 1$$

**Figure 16. Dual Positive Overvoltage Detector**

The above figure shows the MC34161 configured as a dual positive undervoltage detector. As the input voltage decreases towards ground, the LED will turn 'ON' when  $V_{S1}$  or  $V_{S2}$  falls below  $V_1$ . With the dashed line output connection, the circuit becomes a dual positive overvoltage detector. As the input voltage increases from ground, the LED will turn 'ON' when  $V_{S1}$  or  $V_{S2}$  exceeds  $V_2$ .

For known resistor values, the voltage trip points are:

$$V_1 = (V_{th} - V_H) \left( \frac{R_2}{R_1} + 1 \right) \quad V_2 = V_{th} \left( \frac{R_2}{R_1} + 1 \right)$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_2}{R_1} = \frac{V_1}{V_{th} - V_H} - 1 \quad \frac{R_2}{R_1} = \frac{V_2}{V_{th}} - 1$$

**Figure 17. Dual Positive Undervoltage Detector**

# MC34161, MC33161, NCV33161

The above figure shows the MC34161 configured as a dual negative overvoltage detector. As the input voltage increases from ground, the LED will turn 'ON' when  $-V_{S1}$  or  $-V_{S2}$  exceeds  $V_2$ . With the dashed line output connection, the circuit becomes a dual negative undervoltage detector. As the input voltage decreases from the peak towards ground, the LED will turn 'ON' when  $-V_{S1}$  or  $-V_{S2}$  falls below  $V_1$ .

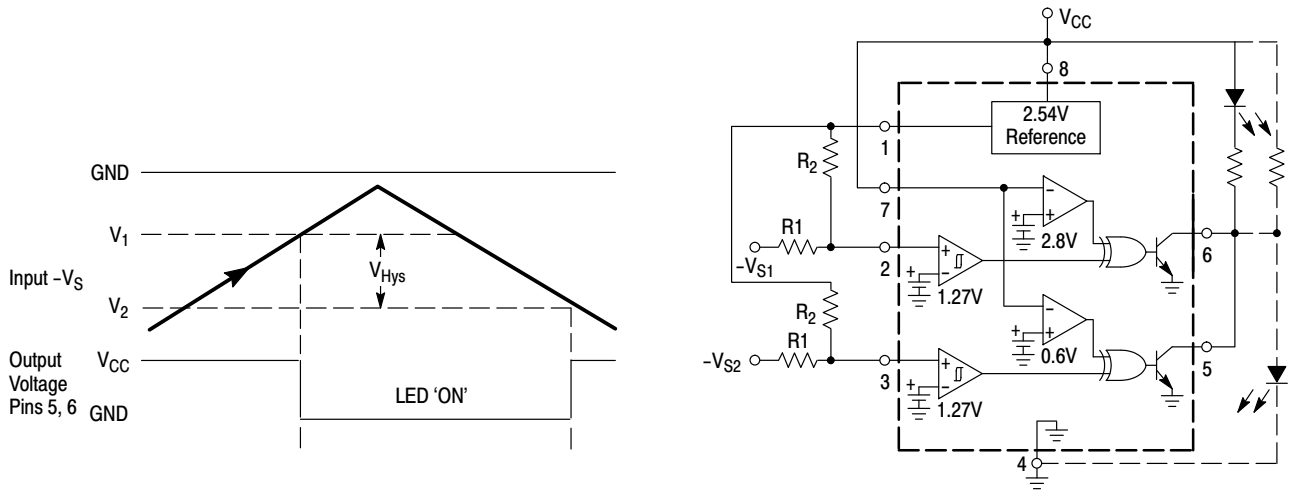

For known resistor values, the voltage trip points are:

$$V_1 = \frac{R_1}{R_2}(V_{th} - V_{ref}) + V_{th} \quad V_2 = \frac{R_1}{R_2}(V_{th} - V_H - V_{ref}) + V_{th} - V_H$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_1}{R_2} = \frac{V_1 - V_{th}}{V_{th} - V_{ref}} \quad \frac{R_1}{R_2} = \frac{V_2 - V_{th} + V_H}{V_{th} - V_H - V_{ref}}$$

**Figure 18. Dual Negative Overvoltage Detector**

The above figure shows the MC34161 configured as a dual negative undervoltage detector. As the input voltage decreases towards ground, the LED will turn 'ON' when  $-V_{S1}$  or  $-V_{S2}$  falls below  $V_1$ . With the dashed line output connection, the circuit becomes a dual negative overvoltage detector. As the input voltage increases from ground, the LED will turn 'ON' when  $-V_{S1}$  or  $-V_{S2}$  exceeds  $V_2$ .

For known resistor values, the voltage trip points are:

$$V_1 = \frac{R_1}{R_2}(V_{th} - V_{ref}) + V_{th} \quad V_2 = \frac{R_1}{R_2}(V_{th} - V_H - V_{ref}) + V_{th} - V_H$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_1}{R_2} = \frac{V_1 - V_{th}}{V_{th} - V_{ref}} \quad \frac{R_1}{R_2} = \frac{V_2 - V_{th} + V_H}{V_{th} - V_H - V_{ref}}$$

**Figure 19. Dual Negative Undervoltage Detector**

# MC34161, MC33161, NCV33161

The above figure shows the MC34161 configured as a positive voltage window detector. This is accomplished by connecting channel 1 as an undervoltage detector, and channel 2 as an overvoltage detector. When the input voltage  $V_S$  falls out of the window established by  $V_1$  and  $V_4$ , the LED will turn 'ON'. As the input voltage falls within the window,  $V_S$  increasing from ground and exceeding  $V_2$ , or  $V_S$  decreasing from the peak towards ground and falling below  $V_3$ , the LED will turn 'OFF'. With the dashed line output connection, the LED will turn 'ON' when the input voltage  $V_S$  is within the window.

For known resistor values, the voltage trip points are:

$$V_1 = (V_{th1} - V_{H1}) \left( \frac{R_3}{R_1 + R_2} + 1 \right) \quad V_3 = (V_{th2} - V_{H2}) \left( \frac{R_2 + R_3}{R_1} + 1 \right)$$

$$V_2 = V_{th1} \left( \frac{R_3}{R_1 + R_2} + 1 \right) \quad V_4 = V_{th2} \left( \frac{R_2 + R_3}{R_1} + 1 \right)$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_2}{R_1} = \frac{V_3(V_{th2} - V_{H2})}{V_1(V_{th1} - V_{H1})} - 1 \quad \frac{R_3}{R_1} = \frac{V_3(V_1 - V_{th1} + V_{H1})}{V_1(V_{th2} - V_{H2})}$$

$$\frac{R_2}{R_1} = \frac{V_4 \times V_{th1}}{V_2 \times V_{th2}} - 1 \quad \frac{R_3}{R_1} = \frac{V_4(V_2 - V_{th1})}{V_2 \times V_{th2}}$$

**Figure 20. Positive Voltage Window Detector**

The above figure shows the MC34161 configured as a negative voltage window detector. When the input voltage  $-V_S$  falls out of the window established by  $V_1$  and  $V_4$ , the LED will turn 'ON'. As the input voltage falls within the window,  $-V_S$  increasing from ground and exceeding  $V_2$ , or  $-V_S$  decreasing from the peak towards ground and falling below  $V_3$ , the LED will turn 'OFF'. With the dashed line output connection, the LED will turn 'ON' when the input voltage  $-V_S$  is within the window.

For known resistor values, the voltage trip points are:

$$V_1 = \frac{R_1(V_{th2} - V_{ref})}{R_2 + R_3} + V_{th2}$$

$$V_2 = \frac{R_1(V_{th2} - V_{H2} - V_{ref})}{R_2 + R_3} + V_{th2} - V_{H2}$$

$$V_3 = \frac{(R_1 + R_2)(V_{th1} - V_{ref})}{R_3} + V_{th1}$$

$$V_4 = \frac{(R_1 + R_2)(V_{th1} - V_{H1} - V_{ref})}{R_3} + V_{th1} - V_{H1}$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_1}{R_2 + R_3} = \frac{V_1 - V_{th2}}{V_{th2} - V_{ref}}$$

$$\frac{R_1}{R_2 + R_3} = \frac{V_2 - V_{th2} + V_{H2}}{V_{th2} - V_{H2} - V_{ref}}$$

$$\frac{R_3}{R_1 + R_2} = \frac{V_{th1} - V_{ref}}{V_3 - V_{th1}}$$

$$\frac{R_3}{R_1 + R_2} = \frac{V_{th1} - V_{H1} - V_{ref}}{V_4 + V_{H1} - V_{th1}}$$

**Figure 21. Negative Voltage Window Detector**

# MC34161, MC33161, NCV33161

The above figure shows the MC34161 configured as a positive and negative overvoltage detector. As the input voltage increases from ground, the LED will turn 'ON' when either  $-V_{S1}$  exceeds  $V_2$ , or  $V_{S2}$  exceeds  $V_4$ . With the dashed line output connection, the circuit becomes a positive and negative undervoltage detector. As the input voltage decreases from the peak towards ground, the LED will turn 'ON' when either  $V_{S2}$  falls below  $V_3$ , or  $-V_{S1}$  falls below  $V_1$ .

For known resistor values, the voltage trip points are:

$$V_1 = \frac{R_3}{R_4}(V_{th1} - V_{ref}) + V_{th1} \quad V_3 = (V_{th2} - V_{H2})\left(\frac{R_2}{R_1} + 1\right)$$

$$V_2 = \frac{R_3}{R_4}(V_{th1} - V_{H1} - V_{ref}) + V_{th1} - V_{H1} \quad V_4 = V_{th2}\left(\frac{R_2}{R_1} + 1\right)$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_3}{R_4} = \frac{(V_1 - V_{th1})}{(V_{th1} - V_{ref})} \quad \frac{R_2}{R_1} = \frac{V_4}{V_{th2}} - 1$$

$$\frac{R_3}{R_4} = \frac{(V_2 - V_{th1} + V_{H1})}{(V_{th1} - V_{H1} - V_{ref})} \quad \frac{R_2}{R_1} = \frac{V_3}{V_{th2} - V_{H2}} - 1$$

**Figure 22. Positive and Negative Overvoltage Detector**

The above figure shows the MC34161 configured as a positive and negative undervoltage detector. As the input voltage decreases toward ground, the LED will turn 'ON' when either  $V_{S1}$  falls below  $V_1$ , or  $-V_{S2}$  falls below  $V_3$ . With the dashed line output connection, the circuit becomes a positive and negative overvoltage detector. As the input voltage increases from the ground, the LED will turn 'ON' when either  $V_{S1}$  exceeds  $V_2$ , or  $-V_{S1}$  exceeds  $V_1$ .

For known resistor values, the voltage trip points are:

$$V_1 = (V_{th1} - V_{H1})\left(\frac{R_4}{R_3} + 1\right) \quad V_3 = \frac{R_1}{R_2}(V_{th} - V_{ref}) + V_{th2}$$

$$V_2 = V_{th1}\left(\frac{R_4}{R_3} + 1\right) \quad V_4 = \frac{R_1}{R_2}(V_{th} - V_{H2} - V_{ref}) + V_{th2} - V_{H2}$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_4}{R_3} = \frac{V_2}{V_{th1}} - 1 \quad \frac{R_1}{R_2} = \frac{V_4 + V_{H2} - V_{th2}}{V_{th2} - V_{H2} - V_{ref}}$$

$$\frac{R_4}{R_3} = \frac{V_1}{V_{th1} - V_{H1}} - 1 \quad \frac{R_1}{R_2} = \frac{V_3 - V_{th2}}{V_{th2} - V_{ref}}$$

**Figure 23. Positive and Negative Undervoltage Detector**

# MC34161, MC33161, NCV33161

The above figure shows the MC34161 configured as an overvoltage detector with an audio alarm. Channel 1 monitors input voltage  $V_S$  while channel 2 is connected as a simple RC oscillator. As the input voltage increases from ground, the output of channel 1 allows the oscillator to turn 'ON' when  $V_S$  exceeds  $V_2$ .

For known resistor values, the voltage trip points are:

$$V_1 = (V_{th} - V_H) \left( \frac{R_2}{R_1} + 1 \right) \quad V_2 = V_{th} \left( \frac{R_2}{R_1} + 1 \right)$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_2}{R_1} = \frac{V_1}{V_{th} - V_H} - 1 \quad \frac{R_2}{R_1} = \frac{V_2}{V_{th}} - 1$$

**Figure 24. Overvoltage Detector with Audio Alarm**

The above figure shows the MC34161 configured as a microprocessor reset with a time delay. Channel 2 monitors input voltage  $V_S$  while channel 1 performs the time delay function. As the input voltage decreases towards ground, the output of channel 2 quickly discharges  $C_{DLY}$  when  $V_S$  falls below  $V_1$ . As the input voltage increases from ground, the output of channel 2 allows  $R_{DLY}$  to charge  $C_{DLY}$  when  $V_S$  exceeds  $V_2$ .

For known resistor values, the voltage trip points are:

$$V_1 = (V_{th} - V_H) \left( \frac{R_2}{R_1} + 1 \right) \quad V_2 = V_{th} \left( \frac{R_2}{R_1} + 1 \right)$$

For a specific trip voltage, the required resistor ratio is:

$$\frac{R_2}{R_1} = \frac{V_1}{V_{th} - V_H} - 1 \quad \frac{R_2}{R_1} = \frac{V_2}{V_{th}} - 1$$

For known  $R_{DLY}$   $C_{DLY}$  values, the reset time delay is:

$$t_{DLY} = R_{DLY} C_{DLY} \ln \left( \frac{1}{1 - \frac{V_{th}}{V_{CC}}} \right)$$

**Figure 25. Microprocessor Reset with Time Delay**

# MC34161, MC33161, NCV33161

The above circuit shows the MC34161 configured as an automatic line voltage selector. The IC controls the triac, enabling the circuit to function as a fullwave voltage doubler or a fullwave bridge. Channel 1 senses the negative half cycles of the AC line voltage. If the line voltage is less than 150 V, the circuit will switch from bridge mode to voltage doubling mode after a preset time delay. The delay is controlled by the 100 kΩ resistor and the 10 µF capacitor. If the line voltage is greater than 150 V, the circuit will immediately return to fullwave bridge mode.

**Figure 26. Automatic AC Line Voltage Selector**

# MC34161, MC33161, NCV33161

**Figure 27. Step-Down Converter**

Test	Conditions	Results
Line Regulation	$V_{in} = 9.5 \text{ V to } 24 \text{ V}, I_O = 250 \text{ mA}$	$40 \text{ mV} = \pm 0.1\%$
Load Regulation	$V_{in} = 12 \text{ V}, I_O = 0.25 \text{ mA to } 250 \text{ mA}$	$2.0 \text{ mV} = \pm 0.2\%$
Output Ripple	$V_{in} = 12 \text{ V}, I_O = 250 \text{ mA}$	$50 \text{ mVpp}$
Efficiency	$V_{in} = 12 \text{ V}, I_O = 250 \text{ mA}$	$87.8\%$

The above figure shows the MC34161 configured as a step-down converter. Channel 1 monitors the output voltage while Channel 2 performs the oscillator function. Upon initial powerup, the converter's output voltage will be below nominal, and the output of Channel 1 will allow the oscillator to run. The external switch transistor will eventually pump-up the output capacitor until its voltage exceeds the input threshold of Channel 1. The output of Channel 1 will then switch low and disable the oscillator. The oscillator will commence operation when the output voltage falls below the lower threshold of Channel 1.

## MC34161, MC33161, NCV33161

### ORDERING INFORMATION

Device	Package	Shipping <sup>†</sup>
MC34161PG	PDIP-8 (Pb-Free)	50 Units / Rail

CASE 626-05  
ISSUE P

DATE 22 APR 2015

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: INCHES.
3. DIMENSIONS A, A1 AND L ARE MEASURED WITH THE PACKAGE SEATED IN JEDEC SEATING PLANE GAUGE GS-3.
4. DIMENSIONS D, D1 AND E1 DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS. MOLD FLASH OR PROTRUSIONS ARE NOT TO EXCEED 0.10 INCH.
5. DIMENSION E IS MEASURED AT A POINT 0.015 BELOW DATUM PLANE H WITH THE LEADS CONSTRAINED PERPENDICULAR TO DATUM C.
6. DIMENSION eB IS MEASURED AT THE LEAD TIPS WITH THE LEADS UNCONSTRAINED.
7. DATUM PLANE H IS COINCIDENT WITH THE BOTTOM OF THE LEADS, WHERE THE LEADS EXIT THE BODY.
8. PACKAGE CONTOUR IS OPTIONAL (ROUNDED OR SQUARE CORNERS).
