

## Demonstration board for MASTERGAN1 high power density half-bridge high voltage driver with two 650 V enhanced mode GaN HEMT

### Features

- Half-bridge demonstration board equipped with MASTERGAN1 and able to withstand 600 V
- VCC input on screw connector or pin strip configured for MASTERGAN1 supply voltages
- Complete set of features to drive MASTERGAN1 with single or complementary driving signal
- Embedded deadtime generator to convert single PWM signal into dual complementary LIN and HIN signals with independently adjustable deadtimes
- On board 3.3 V regulator for external circuitry supply (up to 50 mA)
- 35°C/W junction to ambient thermal resistance to evaluate large power topologies
- High frequency connector for MASTERGAN1 GL and GH pin monitoring
- Spare footprint for low side shunt, external bootstrap capacitors and high voltage high capacitance bulk capacitor
- RoHS compliant

### Description

The EVALMASTERGAN1 board is an easy to use and quick to adapt tool to evaluate the characteristics of MASTERGAN1 and to quickly create new topologies without the need of complete PCB design.

The EVALMASTERGAN1 provides an on-board programmable inputs deadtime generator with a single VCC supply (typ. 6 V). An embedded linear voltage regulator offers 3.3 V rail to supply low voltage logic circuit like microcontrollers or FPGA.

Some spare footprints are also included to customize the board to operate with final application. These customizations include: use of separate input signal or single PWM signal, use of external bootstrap diode, separate supply for VCC, PVCC or Vbo and also the use of low side shunt resistor for peak current mode topologies.

All pins of MASTERGAN1 are accessible.

The EVALMASTERGAN1 is 56 x 70 mm wide, FR-4 PCB resulting in an  $R_{th(J-A)}$  of 35 °C/W, without forced airflow.

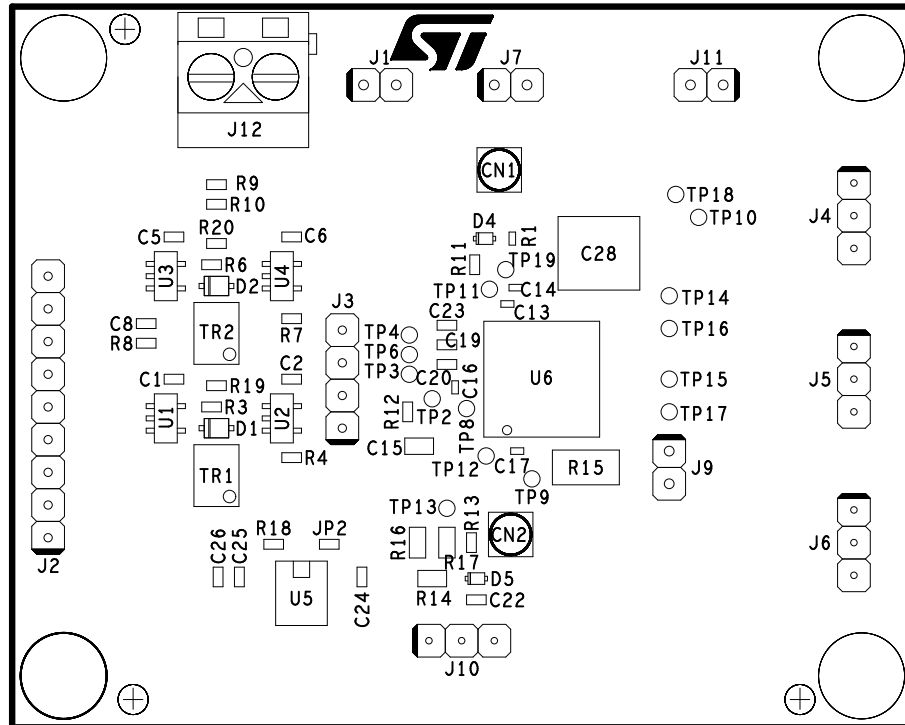

Figure 2. EVALMASTERGAN1 – bottom component placement

## 2 Board power-up and input connection

The following image shows how to supply MASTERGAN1, how to provide LIN and HIN inputs and set the programmable deadtime generator.

**Figure 3. EVALMASTERGAN1 – Supply and signal connection**

The LIN, HIN inputs can be supplied from the on-board deadtime generator or directly from an external generator (as DSP/MCU) with the following settings:

**Table 1. Connector map**

Ref.	Pin #	Name	Function	Description
J2	1	VCC	INPUT power	Board supply voltage: set to a value between 4.5 V and 6 V
	2	VDD (3V3)	OUT power	Output voltage of on-board 3.3 V regulator: it can be used to supply external circuitry (50 mA max.)
	3	GND	PWR	Board reference potential
	4	HIN_B	OUT digital	Buffered HIN signal (0-3.3 V level output)
	5	LIN_B	OUT digital	Buffered LIN signal (0-3.3 V level output)
	6	GND	PWR	Board reference potential
	7	PWM	INPUT digital	PWM input signal (0 to 3.3 V or 5 V) – see <a href="#">Table 3</a>
	8	SD_IN	INPUT digital	Disable input signal (0 to 3.3 V or 5 V) – see <a href="#">Table 3</a>
	9	GND	PWR	Board reference potential

Ref.	Pin #	Name	Function	Description
J3	1	HIN	OUT (INPUT) digital	The pin is connected to HIN pin of MASTERGAN1: the pin can be used either to monitor the output of the deadtime generator or to force the input to MASTERGAN1 according to the status of R4 (see Table 2)
	2	GND	PWR	Board reference potential
	3	GND	PWR	Board reference potential
	4	LIN	OUT (INPUT) digital	The pin is connected to LIN pin of MASTERGAN1: the pin can be used either to monitor the output of the deadtime generator or to force the input to MASTERGAN1 according to the status of R7 (see Table 2)
J4	1,2,3	HV	INPUT power	These three pins are connected to VS pins of MASTERGAN1: connect high voltage potential to this pin according to MASTERGAN1 recommended values (520 V)
J5	1,2,3	OUT	OUTPUT power	These three pins are connected to OUT pins of MASTERGAN1: connect the load to this terminal (resonant tanks, transformers,...)
J6	1,2,3	LS_S	POWER	These three pins are connected to SENSE pins of MASTERGAN1: the board is configured with shorted sense resistor (R15), therefore this pin can be connected to the reference voltage of high voltage potential (GND_P)
J12	1	VCC	INPUT power	Board Supply voltage: set to a value between 4.5 V and 6 V
	2	GND	POWER	Board reference potential
CN1		GH	OUTPUT	To be used with proper MMCX male connector to monitor the GH pin of MASTERGAN1 with high bandwidth, high voltage differential probes (optically isolated probes are recommended)
CN2		GL	OUTPUT	To be used with proper MMCX male connector to monitor the GL pin of MASTERGAN1 with high bandwidth differential probes (optically isolated probes are recommended)

**Table 2. Device input selection**

R4, R7	Input source	Function and description
0-47 $\Omega$ (closed)	J2: PWM pin	LIN & HIN are generated by the on-board deadtime generator from a single PWM signal on J2, PIN 7.
Open	J3: LIN & HIN pin	Direct connection to LIN & HIN MASTERGAN1 pins. LIN, HIN input range: up to 20 V

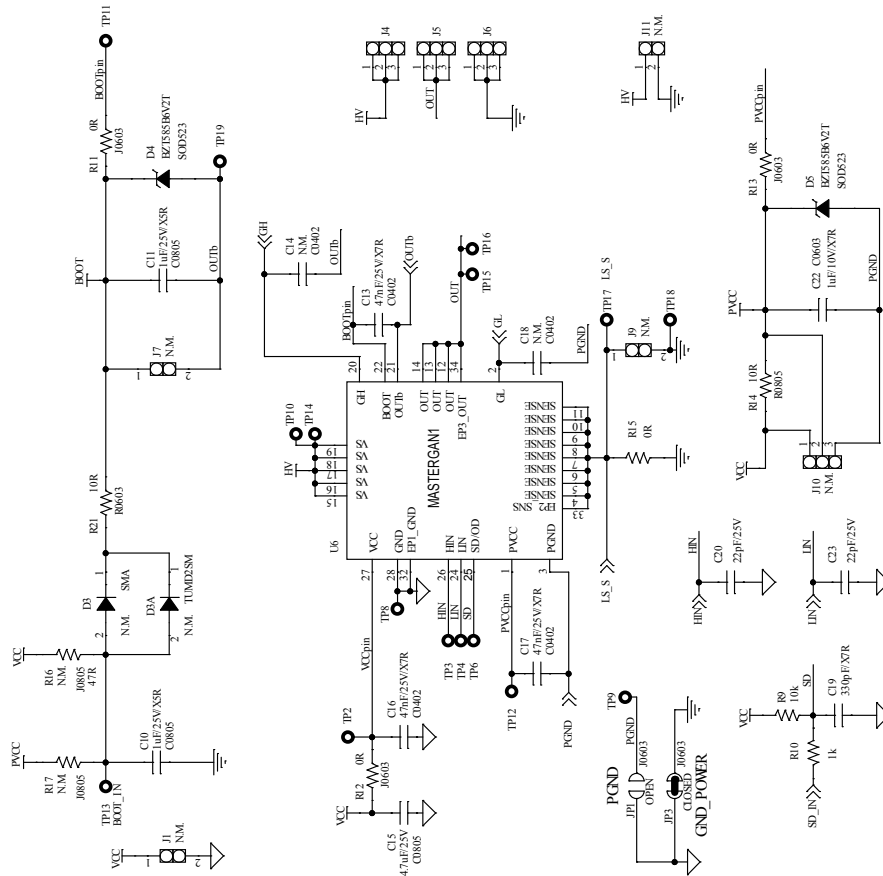

**Table 3. Input signal truth table**

SD_IN	PWM	LIN	HIN
L	X	L	L
H	L	H	L
H	H	L	H

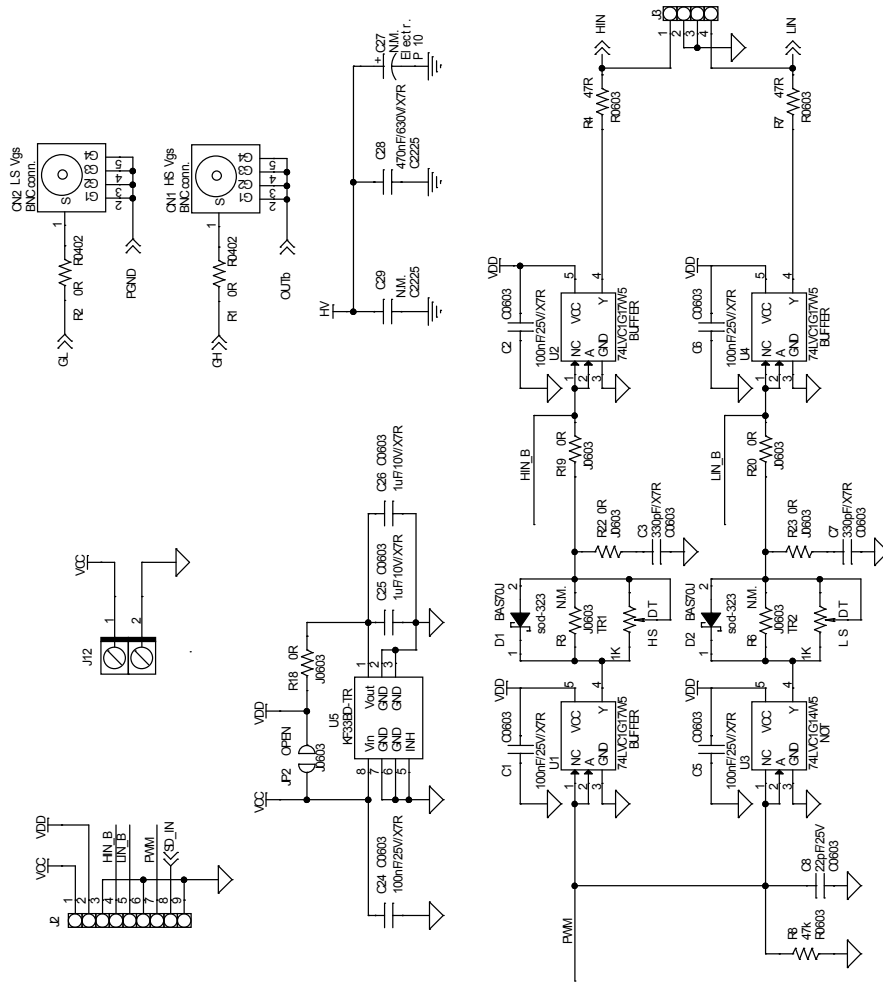

The recommended power-on sequence is to turn VCC on first, then apply the HV bus voltage. The recommended power-off sequence is to turn off the HV bus supply first, then VCC.
