Certificate of Validation in equivalency between Inventek's ISM43340 and ISM43341

This Certificate of Validation confirms that Inventek's ISM43340 and ISM43341 products and all associated evaluation boards are identical in design with the exception that the ISM43341 also having been originally intended to support NFC.

Both platforms and all associated evaluation boards support 802.11a/b/g/n and BT 4.0.

Both platforms are identical in architecture and features/performance with the exception that the ISM43341 was originally intended to support NFC as well.

Any customers intending to use the ISM43340 or ISM43341 for the identical Wi-Fi and BT/BLE features that both these platforms offer would require no differences in design and/or communication to the target device.

The Cypress acquisition of Broadcom IoT did not include the NFC radio therefore the NFC radio originally intended to be part of the feature set in the ISM43341 was no longer supported.

Please do not hesitate to reach out to Inventek Systems for any additional information.
