15	VIP1_MULTI_CHANNEL_SELECT	Video Input Port 1 Multi Channel Select 0 : VIP_PARSER A and B channels operate in single channel mode 1 : VIP_PARSER A and B channels directly drive VPDMA (multi-channel case) Multi-Channel means that the A and B sources are from multiple channels and used in a multiplexed stream mode. The VIP Parser extracts the channel ID from each source and outputs this information to VPDMA, and thus to memory. When operating in a multiplexed stream mode, this bit must be set to 1 to enable the channel information to be passed to memory. If this is not set, the channel number (or source number) will be 0 for all streams. If vip1_rgb_out_select = 1, then VIP_PARSER A port is connected to VPDMA	RW	0x0

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port A logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Bits	Field Name	Description	Type	Reset
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable Port 1 = Enable Port	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0
5:4	CTRL_CHAN_SEL	Embedded Sync Only In 8b mode.. there is only one channel on data[7:0]. In 16b mode.. there are two channels. The Luma Channel is on data[15:8]. The Chroma Channel is on data[7:0]. In 24b mode.. there are three channels. The R channel is on data[23:16].. the G channel is on [15:8]. and the B channel is on data[7:0]. 00 = Use data[7:0] to extract control codes. 01 = Use data[15:8] to extract control codes. 10 = Use data[23:16] to extract control codes. 11 = Undefined In 16b and 24b modes.. this register is also used to select the channel from which Ancillary Data is extracted. The Ancillary Data channel must be the same as the control code channel. For 8b mode.. the anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single 4:2:2 YUV stream 0001 = embedded sync 2x multiplexed 4:2:2 YUV stream 0010 = embedded sync 4x multiplexed 4:2:2 YUV stream 0011 = embedded sync line multiplexed 4:2:2 YUV stream 0100 = discrete sync single 4:2:2 YUV stream 0101 = embedded sync single RGB stream or single 444 YUV stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

YUV_SRCNUM_STOP_IMMEDIATELY																ANC_SRCNUM_STOP_IMMEDIATELY															

Bits	Field Name	Description	Type	Reset
31:16	YUV_SRCNUM_STOP_IMMEDIATELY	For the Active Video Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for T1 line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. A <code>?1?</code> in a bit position means that it is ok for a <code>srcnum</code> to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that <code>srcnum</code> is set to <code>?0?</code> , the port will never disable.	RW	0x0
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for T1 line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		RW	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. (Same format conversion as A0)	RW	0x0
15:13	RESERVED		RW	0x0
12:0	A0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. Rules for converting a real number coefficient to a 12-bit hex number for this register: - If the real number is positive, then simply multiply it by 1024, and convert the integer part to hex format. For example, 0.673 X 1024 = 689.152, then 0x2B1 should fill in to this register - If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is -1.893, by *1024 to this number, it becomes -1938. The 2'S compliment format of -1938 is 0x186E (in 13-bit width). Then 0x186E should be the number assigned to this register.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH from the offset specified by ofW and offH. 0: disable trimming 1: enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by both horizontal and vertical scaling 0: the input video format is progressive 1: the input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON'T CARE. If cfg_auto_hs is 1, 0: The polyphase scaler is always used regardless of the scaling ratio. 1: The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio 0.25). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 horizontal scale ratio 0.5). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0: the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 1: HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 SR 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 SR 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR = 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	CFG_ENABLE_EV	This parameter is used by the edge-detection block. 0: The output of edge-detection block will be force to ?0? 1: The calculation results of edge-detection block will be output normally	RW	0x0
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0: Poly-phase filter will be used for the vertical scaling 1: Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INV_T_FID	This parameter is used by vertical scaling. 0: Progressive input 1: Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is a general purpose. 0: Scaling module will engaged 1: Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0: Anamorphic scaling 1: Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0: The output format of SC is progressive 1: The output format of SC is interlace	RW	0x0

9.5.6 VIP VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VIP VPDMA in this family of devices:

- All VIP_INT2_* registers
- All VIP_INT3_* registers

The following channels are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- HQ_*
- GRPX_*
- SCALER_OUT
- SCALER_LUMA
- SCALER_CHROMA
- NF_*
- TRANSCODE1_*
- TRANSCODE2_*
- AUX_IN
- PIP_FRAME
- POST_COMP_WR
- VBI_SD_VENC

The following clients are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- DEI_HQ_*
 - TRANS1_LUMA
 - TRANS1_CHROMA
 - TRANS2_LUMA
 - TRANS2_CHROMA
 - HDMI_WRBK
 - VBI_SDVENC
 - NF_420_UV_OUT
 - NF_420_Y_OUT
 - NF_420_UV_IN
 - NF_420_Y_IN
 - NF_422_IN
 - GRPX1_ST
 - GRPX2_ST
 - GRPX3_ST
 - GRPX1_DATA
 - GRPX2_DATA
 - GRPX3_DATA
 - PIP_WRBK
 - SC_IN_*
 - SC_OUT
 - COMP_WRBK

Table 9-293. VIP_LIST_ATTR

Address Offset	0x0000 0008	Instance	VIP1_VPDMA
Physical Address	0x4897 D008		
Description	The attributes of a new list. This register should always be written after VIP_LIST_ADDR .		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				LIST_NUM				RESERVED		STOP	RDY	LIST_TYPE				LIST_SIZE															

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at VIP_LIST_ADDR . If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VIP_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the VIP_LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated.\n0: Normal List\n1: Self-Modifying List\n2: List Doorbell\nOthers Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
26	INT_STAT_VIP1_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
17	INT_STAT_VIP1_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP1_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
8	INT_STAT_VIP1_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src14</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

26	INT_STAT_VIP1_ANC_A	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
25	INT_STAT_TRANS2_LUMA	The client interface trans2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
24	INT_STAT_TRANS2_CHROMA	The client interface trans2_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
23	INT_STAT_TRANS1_LUMA	The client interface trans1_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
22	INT_STAT_TRANS1_CHROMA	The client interface trans1_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_HDMI_WRBK_OUT	The client interface hdmi_wrbk_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
20	INT_STAT_VPI_CTL	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
19	INT_STAT_VBI_SDVENC	The client interface vbi_sdvenc has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
18	RESERVED	Reserved	R	0
17	INT_STAT_NF_420_UV_OUT	The client interface nf_420_uv_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
16	INT_STAT_NF_420_Y_OUT	The client interface nf_420_y_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
15	INT_STAT_NF_420_UV_IN	The client interface nf_420_uv_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
14	INT_STAT_NF_420_Y_IN	The client interface nf_420_y_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
13	INT_STAT_NF_422_IN	The client interface nf_422_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_GRPX3_ST	The client interface grpx3_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
11	INT_STAT_GRPX2_ST	The client interface grpx2_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
10	INT_STAT_GRPX1_ST	The client interface grpx1_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
9	INT_STAT_VIP2_UP_UV	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
8	INT_STAT_VIP2_UP_Y	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
7	INT_STAT_VIP2_LO_UV	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
6	INT_STAT_VIP2_LO_Y	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
5	INT_STAT_VIP1_UP_UV	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_UP_Y	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
3	INT_STAT_VIP1_LO_UV	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
2	INT_STAT_VIP1_LO_Y	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
1	INT_STAT_GRPX3_DATA	The client interface grp3_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
0	INT_STAT_GRPX2_DATA	The client interface grp2_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP1_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
8	INT_STAT_VIP1_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrkb will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrkb will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrkb_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src14</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
8	INT_STAT_VIP2_UP_Y	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
7	INT_STAT_VIP2_LO_UV	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
6	INT_STAT_VIP2_LO_Y	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
5	INT_STAT_VIP1_UP_UV	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_UP_Y	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
3	INT_STAT_VIP1_LO_UV	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
2	INT_STAT_VIP1_LO_Y	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
1	INT_STAT_GRPX3_DATA	The client interface grpx3_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
0	INT_STAT_GRPX2_DATA	The client interface grpx2_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_CONTROL_DESCRIPTOR_INT15	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_CONTROL_DESCRIPTOR_INT14	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_CONTROL_DESCRIPTOR_INT13	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Description	The register holds status information and control for the client.\n		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START	RESERVED												

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0

Bits	Field Name	Description	Type	Reset
13:10	FRAME_START	The source of the start frame event for the client.\n0 : Change in value of hdmi_field_id\n1 : Change in value of dvo2_field_id\n2 : Change in value of hdcomp_field_id\n3 : Change in value of sd_field_id\n4 : Use List Manager Internal Field0\n5 : Use List Manager Internal Field1\n6 : Use List Manager Internal Field2\n7 : Start on channel active	RW	0x0

Video Processing Engine

This chapter describes the video processing engine (VPE) for the device.

Topic	Page
10.1 VPE Overview	2311
10.2 VPE Integration.....	2312
10.3 VPE Functional Description	2314
10.4 VPE Register Manual	2412

10.1 VPE Overview

VPE Features:

- Supports memory to memory operations only.
- VPE consist of a single memory to memory path which can perform the following operations:
 - Read of raster or tiled YUV420 coplanar, YUV422 coplanar or YUV422 interleaved video
 - Deinterlacing of the input video using a 4 field motion based algorithm
 - Scaling of the input video up to 1080p (1920x1080) resolution
 - Write of the resulting video in YUV420 coplanar (raster or tiled), YUV422 coplanar (raster or tiled), YUV422 interleaved (raster or tiled), YUV444 single plane (raster only) or RGB888 (raster only)
 - Deinterlacing up to two 1080i video sources.
 - The single data path performs operations in the following order
 - Chroma Upsampling from 420 to 422 (if needed)
 - Deinterlacing of 422 video from interlaced to progressive (if needed)
 - Scaling of 422 video after deinterlace
 - Conversion of 422 video to 420, 444 or RGB (if needed)
 - VC-1 Range Mapping and Range Reduction support on input video before Chroma Upsampling (if needed)
- Chroma Upsampling Features
 - 4 line Catmull-Rom based implementation
 - Programmable coefficients for interlaced or progressive conversion. Separate coefficients can be provided for top and bottom fields
- Deinterlacer Features
 - 8-bit, YCbCr 4:2:2
 - Motion-adaptive deinterlacing (MDT)
 - Motion detection is based on Luma only
 - 4-field data is used
 - Motion values adaptive to the frequency of luma texture
 - Edge-Directed Interpolation (EDI)
 - Edge detection using luma pixels in a 2x7 window
 - Seven edge vectors: -1.5, -1, -0.5, 0, 0.5, 1, 1.5
 - Edge-directed chroma interpolation
 - Soft-switch between edge directed interpolation and vertical interpolation depending on the confidence factor
 - Film Mode Detection (FMD)
 - 3-2 pull down detection
 - 2-2 pull down detection
 - Hysteresis controls how fast FMD can enter/exit film mode (software function)
 - Bad Edit Detection (BED)
 - Progressive Input
 - For Progressive Input, the module passes input to output. No internal processing is performed. This is essentially a bypass mode
 - Interlace Bypass
 - For Interlace Input, the module can pass the inputs data directly to the outputs in a bypass configuration. No internal processing is performed
- Scaler Features
 - Vertical and horizontal up/down scaling
 - Polyphase filter upscaling

- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Minimum horizontal scaling ratio = 1/8x
- Maximum horizontal scaling ratio – limited by output line buffer (2014 pixels)
- Scaling filter Coefficient memory download
- Chroma Downsampler Features
 - Simple two-line averager capable of converting from YUV422 to YUV420 space
- 422 to 444 Features
 - Catmull-Rom based filter
 - 4 pixel, fixed coefficient
- Color Space Converter Features
 - Fully programmable 3x3 matrix multiplier with offset control

10.2 VPE Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. [Figure 10-1](#) summarizes the integration of the module in the device.

Figure 10-1. VPE Integration

NOTE: Alternative clocking to the VPE module is provided from DPLL_VIDEO1. For more information about configuring DPLL_VIDEO1, see [Section 11.1.2.1, Display Subsystem Clocks](#). Source clock selection is done with CTRL_CORE_SMA_SW_1[8] VPE_CLK_DIV_BY_2_EN register from the Control Module. For more information, see [Chapter 18, Control Module](#).

Table 10-1 and Table 10-2 list the integration attributes and clock and resets, respectively.

Table 10-1. VPE Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VPE	PD_VPE	L4_PER3 for configuration L3_MAIN for data (through VPDMA module)

Table 10-2. VPE Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VPE	L3_CLK PROC_CLK	VPE_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VPDMA uses this clock to send and receive external data and transfer this data to internal processing. PROC_CLK is the clock used to drive data processing within the VPE subsystem.
	L4_CLK PROC_D2_CLK	VPE_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus PROC_D2_CLK is an additional clock used by the DEI within the DEI Subsystem. Inputs and outputs of the DEI operate on PROC_CLK, but internally, the data paths within the DEI operate on this clock.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VPE	VPE_RST	VPE_RST	PRCM	VPE Reset

Table 10-3. VPE Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
VPE	VPE_IRQ	IRQ_CROSSBAR_354	N/A	VPE interrupt requests. These IRQ source signals are not mapped by default to any device INTC.

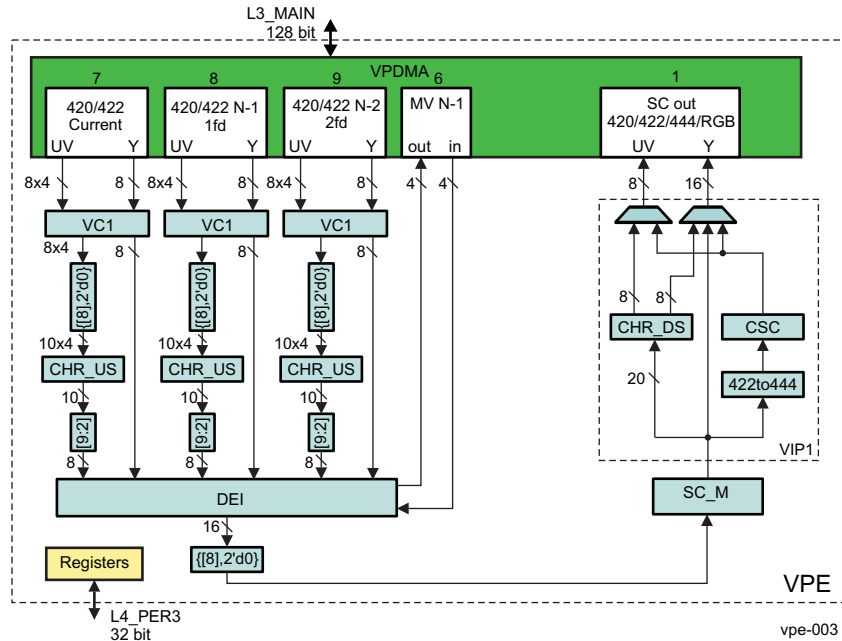

NOTE: The “Default Mapping” column in [Table 10-3 VPE Hardware Requests](#) shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see [Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#).
For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

10.3 VPE Functional Description

10.3.1 VPE Block Diagram

[Figure 10-2](#) shows the internal structure of the VPE module in the device.

Figure 10-2. VPE Block Diagram

10.3.2 VPE VC1 Range Mapping/Range Reduction

VC1 range mapping and range reduction is implemented prior to the Chroma Upsampler (CHR_US) in the Primary Input Paths of the module.

Range Mapping is performed by setting VPE_CLKC_RANGE_MAP[6] RANGE_MAP_PRIM_ON bit to '1'. The output for every component is calculated by the following formulas:

$$Y[n] = (((Y[n] - 128) * (RANGE_MAPY_PRIM + 9) + 4) \gg 3) + 128$$

$$Cb[n] = (((Cb[n] - 128) * (RANGE_MAPUV_PRIM + 9) + 4) \gg 3) + 128$$

$$Cr[n] = (((Cr[n] - 128) * (RANGE_MAPUV_PRIM + 9) + 4) \gg 3) + 128$$

In the above, VPE_CLKC_RANGE_MAP[2:0] RANGE_MAPY_PRIM and VPE_CLKC_RANGE_MAP[5:3] RANGE_MAPUV_PRIM are defined as in the register descriptions for each instantiation of this function.

Range Reduction is performed based by setting VPE_CLKC_RANGE_MAP[28] RANGE_REDUCTION_PRIM_ON bit to '1'. The output for the color components is calculated by the following formulas:

$$Y[n] = (Y[n] - 128) * 2 + 128$$

$$Cb[n] = (Cb[n] - 128) * 2 + 128$$

$$Cr[n] = (Cr[n] - 128) * 2 + 128$$

NOTE: The block performs Range Mapping first, and the output of Range Mapping drives Range Reduction. Although Range Mapping and Range Reduction are supposed to be mutually exclusive, the implementation allows both to be done simultaneous.

10.3.3 VPE Deinterlacer (DEI)

10.3.3.1 Functional Description

Figure 10-3 illustrates the block-diagram of motion-adaptive Deinterlacer. The general concept behind motion adaptive deinterlacing is that spatial filtering works very well for images with motion, while temporal filtering works very well for static images. So, the intuitive way is to combine them together. Motion detection is used to switch or fade between the use of spatial deinterlacing and temporal deinterlacing, as shown in the following formula:

$$\hat{y}(j, i, n) = \alpha y_{\text{spat}}(j, i, n) + (1 - \alpha) y_{\text{temp}}(j, i, n)$$

where $y_{\text{spat}}(j, i, n)$ is the spatial interpolation output, $y_{\text{temp}}(j, i, n)$ is temporal interpolation output, α is the motion detection output ranging from 0 to 1, $\hat{y}(j, i, n)$ is the final output from deinterlacer, and j, i, n are the vertical, horizontal, and temporal indexes, respectively. From the previous formula, the final output is controlled by the motion detector output, α . The higher the motion, the higher value of α , and the output favors spatial interpolation. If the motion is absent or very low, the temporal interpolation has higher weight.

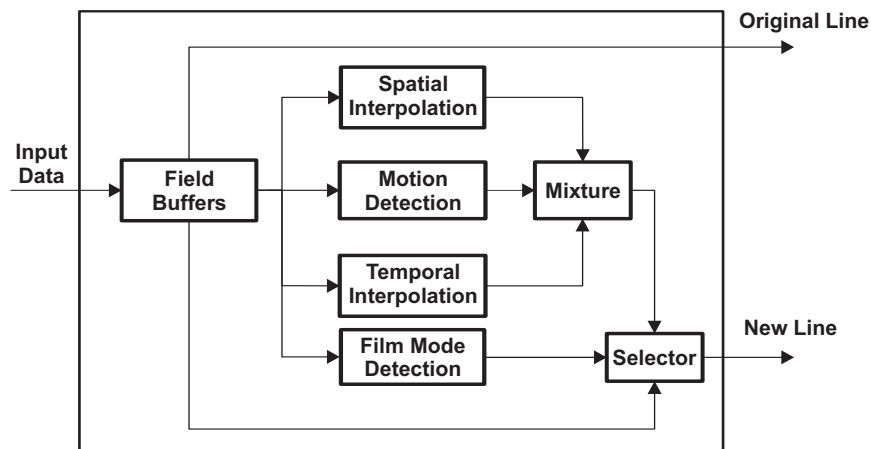

Temporal interpolation can be disabled by programmable control registers. In that case we have:

$$\hat{y}(j, i, n) = y_{\text{spat}}(j, i, n)$$

Chroma interpolation is handled in the same manner as luma with regards to the above equations. There is a separate control for disabling temporal interpolation for chroma, such that luma can perform the full mixture, and chroma can only be spatial. If luma temporal interpolation is disabled, chroma temporal interpolation is also disabled.

Figure 10-3 provides a simple description of how a motion-adaptive deinterlacer operates. The actual interpolation used is edge directed interpolation. Edge directed interpolation is only performed spatially prior to the output mixing.

Figure 10-3. Block Diagram of Motion-Adaptive Deinterlacer

The Deinterlacer consists of:

- MMR Configuration Register Block
 - - Used to program configuration items for the Deinterlacer
- VPDMA Interface Block
 - Used to read source video/motion data from VPDMA
 - Used to write generated motion data to VPDMA
- Motion Detection (MDT) Block
 - Examines 3 fields of input video data (luma only) and calculates a 4 bit motion vector to drive the Edge Directed Interpolation Block

- Edge Directed Interpolation (EDI) Block
 - Performs the motion based edge directed interpolation on Luma and Chroma inputs to generate the missing line in the interlaced source
- Film Mode Detection (FMD) Block
 - Field Difference : Accumulated difference between the spatial interpolated frame and the adjacent input field of opposite field ID
 - Frame Difference : Accumulated difference between two fields with the same field ID
 - Combing Artifacts : Accumulated sum-of-difference between two adjacent fields
- Output Multiplexor (MUX) Block
- Line Buffer Block

10.3.3.2 Bypass Mode

The DEI can be operated in bypass mode and deinterlacer mode.

In the bypass mode, input luma and chroma are buffered and sent to the stage after DEI without processing. To bypass the DEI module registers `VPE_DEI_REGO[31]` `PROGRESSIVE_BYPASS` or `VPE_DEI_REGO[29]` `INTERLACE_BYPASS` must be set to '1' for progressive and interlaced source input respectively.

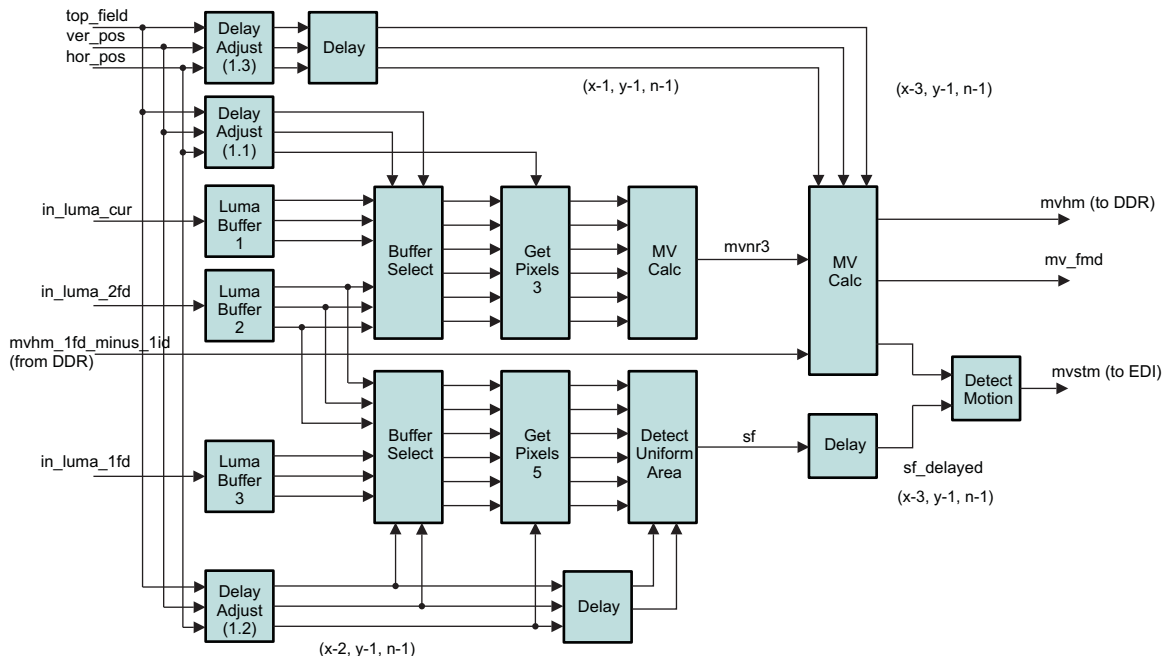

10.3.3.2.1 VPDMA Interface

The VPDMA interface handles transactions between the internal core of the design and the VPI interface protocol, which is used for both external module input and motion vector output. All input data is pixel aligned, but has different request and ready signals. Motion Output is not pixel aligned with input.

10.3.3.2.2 MDT

A block diagram representing the Motion Detection (MDT) Block is shown on [Figure 10-4](#).

Figure 10-4. Motion Detection (MDT) Block Diagram

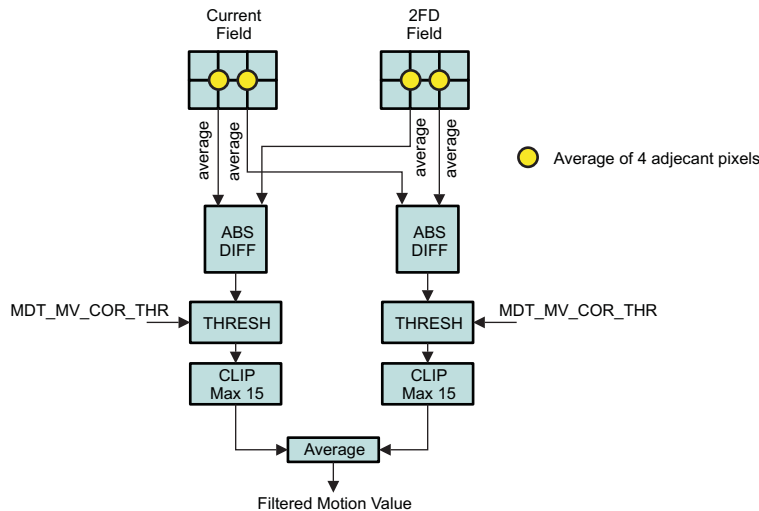

The Motion Detection block takes as input 3 adjacent fields of Luma data, motion data calculated from the previous 3 fields, and the current X, Y and field ID indicators and generates motion vector outputs which drive the Edge Directed Interpolation (EDI), Film Mode (FMD) and output motion values to DDR

There are two parallel paths - Motion Vector Calculation and Uniform Area Detection.

The Motion Vector Calculation path generates the FMD motion vector and the DDR output motion vector. The combination of the Motion Vector and Uniform Area Detection is used to calculate the EDI motion vector value.

The Motion Vector Calculation Path operates using a sliding 3 pixel wide by 2 pixel tall window over 2 adjacent fields of the same field ID polarity (2 top fields or 2 bottom fields). The first stage is to calculate the filtered motion value (MV Calc). The below diagram shows the dataflow for calculating the Filtered Motion Value from MV Calc:

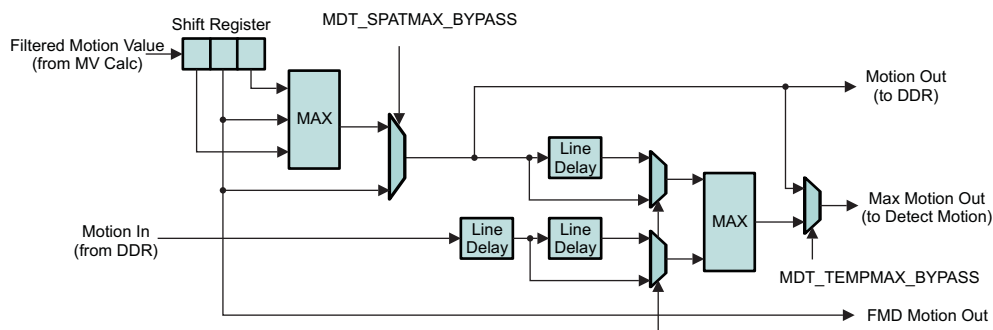

Figure 10-5. Motion Detection (MDT) MV Calc Data Path

The Filtered Motion Value is then operated on by the Max Filter operation, which performs a maximum operation between the last 3 filtered motion values and the last frame's motion value. The process is to calculate the maximum value of the last 3 filter motion values, and this value is written to DDR to be read back in on the next frame. The maximum value is taken between the previous frame's maximum value as read back from DDR, and the maximum value between the current last 3 motion values, and this is passed to the Detect Motion block which will drive the EDI module.

The Film Mode motion value output is just the output from the MV Calc data path. The following diagram shows the data path. Please note the line buffers, which are used to adjust for different polarity of fields (2 motion value fields are of opposite polarity, meaning a 1 line difference in one or the other field):

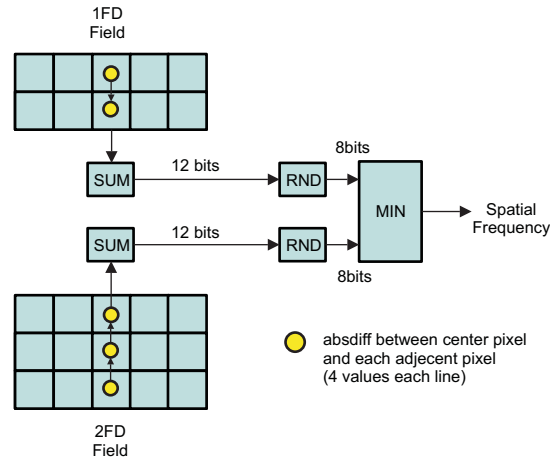

Figure 10-6. Motion Detection (MDT) Max Filter Data Path

vpe-004

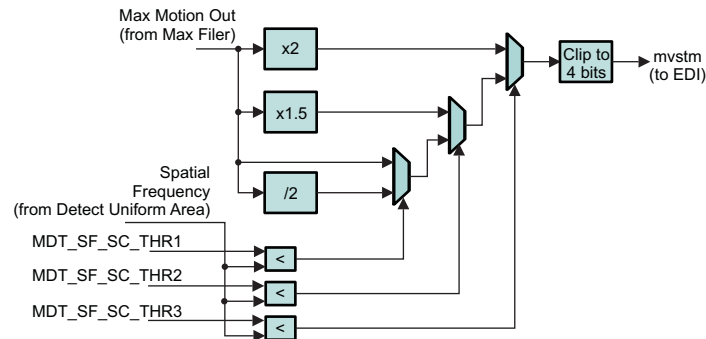

The Uniform Area Detection Path operates using a sliding 5 pixel wide by 3 pixel tall window over 2 adjacent fields of opposite field ID polarity (1 field delay and 2 field delay) to calculate a spatial frequency component. The following diagram shows how this component is calculated within each pixel window:

Figure 10-7. Motion Detection (MDT) Uniform Area Data Path

The spatial frequency output is used to scale the motion vector generated by the Maximum Filter operation based on thresholding against the MMR values `VPE_DEI_REG2[7:0] MDT_SF_SC_THR1`, `VPE_DEI_REG2[15:8] MDT_SF_SC_THR2` and `VPE_DEI_REG2[23:16] MDT_SF_SC_THR3`. The following diagram (in the Detect Motion block) performs this thresholding to generate the final motion vector output to the EDI module:

Figure 10-8. Motion Detection (MDT) Detect Motion Data Path

10.3.3.2.3 EDI

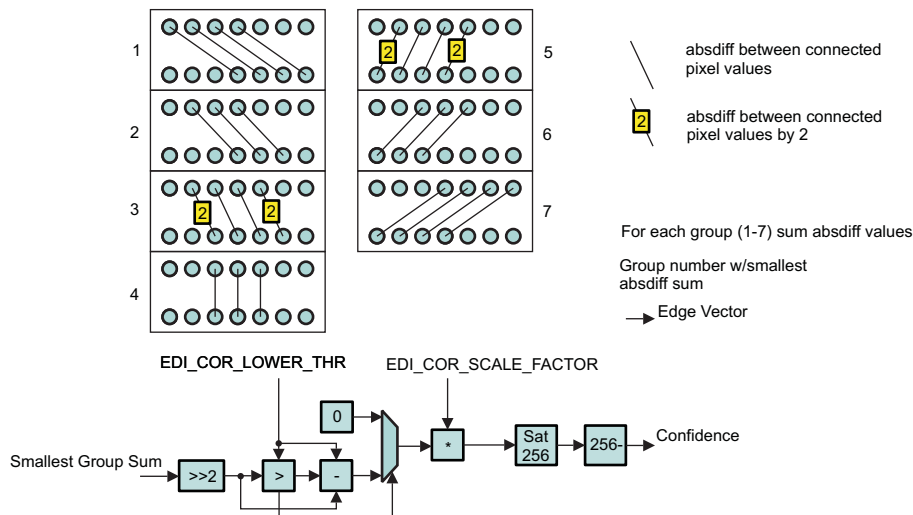

A block diagram representing the Edge Directed Interpolation (EDI) Block is shown on [Figure 10-9](#)

Figure 10-9. Edge Directed Interpolation (EDI) Block Diagram

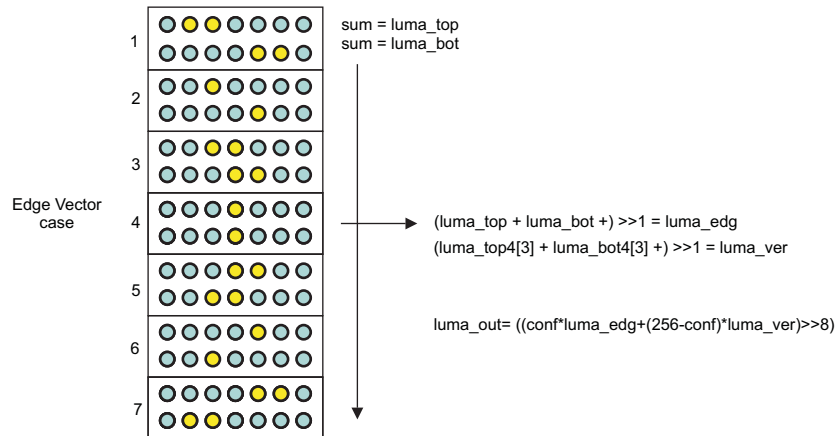

The Edge Directed Interpolation module operates on a 7x2 window (7 pixels wide, 2 in height) in both Luma and Chroma. Luma data is used to calculate an edge vector and edge vector confidence. Correlation scaling factor is set with `VPE_DEI_REG3[31:24] EDI_COR_SCALE_FACTOR` register. A diagram showing this calculation follows (Calc ev):

Figure 10-10. Edge Directed Interpolation Edge Vector Calculation

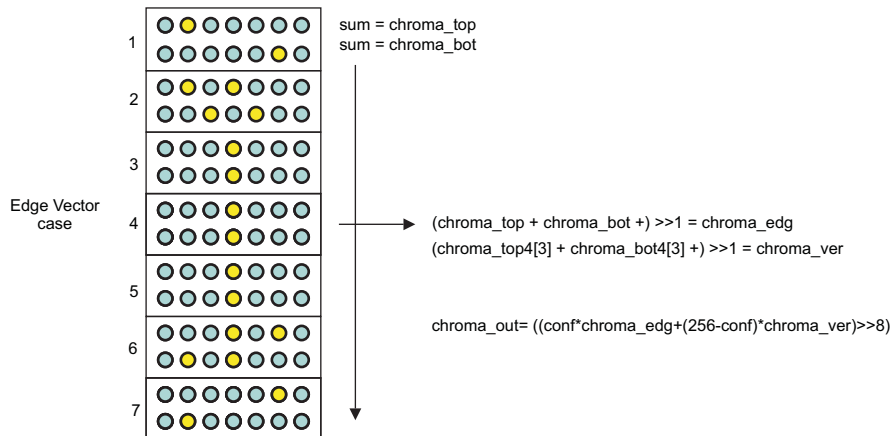

The edge vector and edge vector confidence are passed to the Spatial Interpolation module, which performs edge directed spatial interpolation. Following is a diagram showing how Luma is interpolated:

Figure 10-11. Edge Directed Interpolation Luma Interpolation Calculation

The following diagram shows how Chroma is interpolated:

Figure 10-12. Edge Directed Interpolation Chroma Interpolation Calculation

Each of the cases shown above is on the 7x2 input pixel window for Luma and Chroma, based on the edge vector that was calculated. Each output equation (luma_out and chroma_out) is a combination of a straight vertical interpolation (luma/chroma_ver) and edge directed interpolation (luma/chroma_edge) using the Confidence factor output from the Edge Vector Calculation module. In the case of chroma interpolation, if the register [VPE_DEI_REG3\[1:0\] EDI_INP_MODE = "11"](#), the chroma_out calculated for spatial interpolation is forced to the the vertical chroma output.

The Mix module does that actual mixing of spatial and temporal interpolation to produce the final result. 4 different interpolation modes are supported: Line double, Field double, 3D interpolation and 2D interpolation.

- Line double averages the top and bottom pixel to produce the interpolated pixel. Setting of MDT mode has no effect on output pictures.
- Field double averages the previous and next frame pixel to produce the interpolated pixel. In other words, if the current field is a top field, the interpolated bottom field picture is created by averaging pixels from bottom field pictures before and after the current field
- 2D interpolation uses the Edge Directed interpolation result only as the interpolated pixel
- 3D interpolation uses the EDI LUT table values with the MDT motion vector as an index to blend between the 2D result and the value from the previous field temporally.

NOTE: 3D processing is enabled with [VPE_DEI_REG3\[2\] EDI_ENABLE_3D](#) register

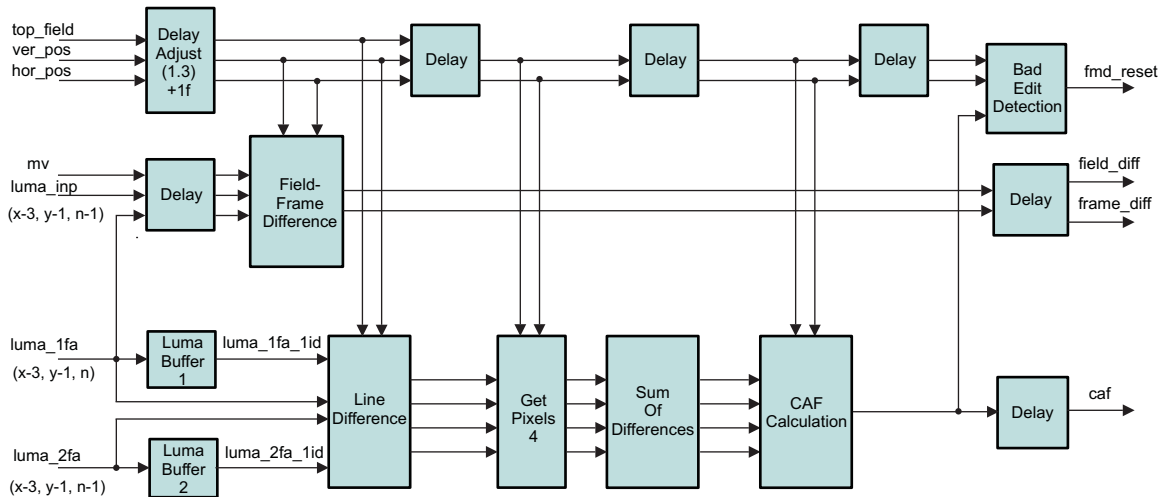

The EDI Lut value selected based on the motion value will perform a blend between temporal and edge directed spatial interpolation using the equation:

$$\hat{y}(j, i, n) = \alpha y_{\text{spat}}(j, i, n) + (1 - \alpha) y_{\text{temp}}(j, i, n)$$

10.3.3.2.4 FMD

The following shows the block diagram of the Film Mode Detection (FMD) module:

Figure 10-13. Film Mode Detection (FMD) Block Diagram

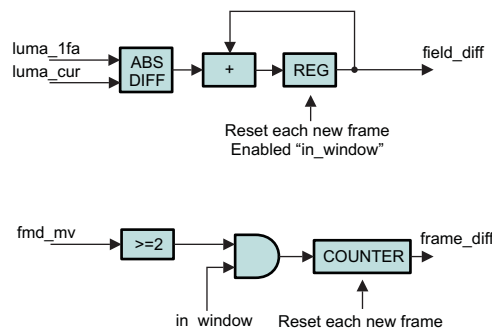

Film Mode Detection calculates four parameters which are used in conjunction with software to determine if the source of the video is film (3:2 or 2:2 sequences). This block is not part of the main data path, but calculates statistics based on the main data path for each frame generated, then interrupts the processor to read the information and then set to '1' the [VPE_DEI_REG10\[1\]](#) FMD_LOCK (lock to film mode) and [VPE_DEI_REG10\[2\]](#) FMD_JAM_DIR (direction of field jam) registers, to set the design to film mode operation.

All of the calculations are performed within a window defined by [VPE_DEI_REG8\[10:0\]](#) FMD_WINDOW_MINX, [VPE_DEI_REG8\[26:16\]](#) FMD_WINDOW_MAXX, [VPE_DEI_REG9\[10:0\]](#) FMD_WINDOW_MINY, [VPE_DEI_REG9\[26:16\]](#) FMD_WINDOW_MAXY. All calculations are reset on each new input frame.

Field difference is calculated as the absolute difference (absdiff) between the current Luma input and the previous field Luma input. Value can be read on [VPE_DEI_REG13\[27:0\]](#) FMD_FIELD_DIFF register. Frame difference is calculated using the motion input from the MDT. Value can be read on [VPE_DEI_REG14\[19:0\]](#) FMD_FRAME_DIFF register. [Figure 10-14](#) is showing how these are calculated is shown below:

Figure 10-14. Film Mode Detection (FMD) Frame/Field Difference Calculation

NOTE: Value of FMD_WINDOW_MAXX must be less than WIDTH and value of FMD_WINDOW_MAXY must be less than 1/2 HEIGHT.

Combing Artifacts value is calculated as shown in Figure 10-15. Value can be read on VPE_DEI_REG12[20:0] FMD_CAF register.

Figure 10-15. Film Mode Detection (FMD) Combing Artifacts Calculation

FMD_RESET is set to tell software when the Film Mode Detection should be unlocked back to normal operation. The logic controlling this is based on the caf output, and is set based on caf being above a threshold set by VPE_DEI_REG11[19:0] FMD_CAF_THR and where within the window the current x/y position is. If the position is over 3/4 in height, and $caf > FMD_CAF_THR$ OR if over 1/2 in height and $caf > 3/4 * FMD_CAF_THR$ OR if over 1/4 in height and $caf > 1/4 * FMD_CAF_THR$, then VPE_DEI_REG12[24] FMD_RESET must be set (it will clear at the start of the next field input).

The Film Mode Interrupt (fmd_int) will be generated at the end of the window defined for FMD operation and tells software to read the above parameters. When the interrupt fires, the above parameters are latched into the DEI Control Interface (MMR) so they can be read.

10.3.3.2.5 MUX

The MUX block generates the proper outputs based whether the design is in standard Deinterlacer modes (interpolated inputs from the EDI), Film Mode Deinterlacer mode (direct inputs) or progressive bypass mode. The following diagram shows this data path:

Figure 10-16. Film Mode Detection (FMD) Combing Artifacts Data Path

When in Film Mode (VPE_DEI_REG10[1] FMD_LOCK = '1'), the output of the DEI depends only on the input field sequences. Depending on the Jam Direction, either the previous or next field data is output. If not in Film Mode, the interpolated result from the EDI is output.

Because the DEI produces the missing line in an interlaced frame, what this part of the data path is selecting is the “interpolated” line. The other line output is the current line. Together, the interpolated line and the current line form the actual output of the main part of the DEI data path. Depending on if the current field is a top field or bottom field (as selected by Field ID), the output “top” of the MUX is either the current or interpolated lines, and the output “bot” is the opposite.

10.3.3.2.6 LINE BUFFER

The Line Buffer takes two lines of data (top line and bottom line) and serializes this into a single stream. The following diagram shows this data path:

The sequencing is such that LBUF0 is being written while LBUF1 is being read. When LBUF0 has been completely written, it will try to write to LBUF1 next. If on the output side LBUF1 has not been completely read, then the data path will stall waiting for the output to finish reading LBUF1 and switch to reading LBUF0 (and visa versa)

10.3.4 VPE Scaler (SC)

This section is used for driver development for the highly optimized video resizers, SC (scalers), in the VPE module.

10.3.4.1 SC Features

- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

10.3.4.2 SC Functional Description

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. [Figure 10-18](#) shows the high-level block diagram of the scaler module.

Figure 10-18. High Level Block Diagram

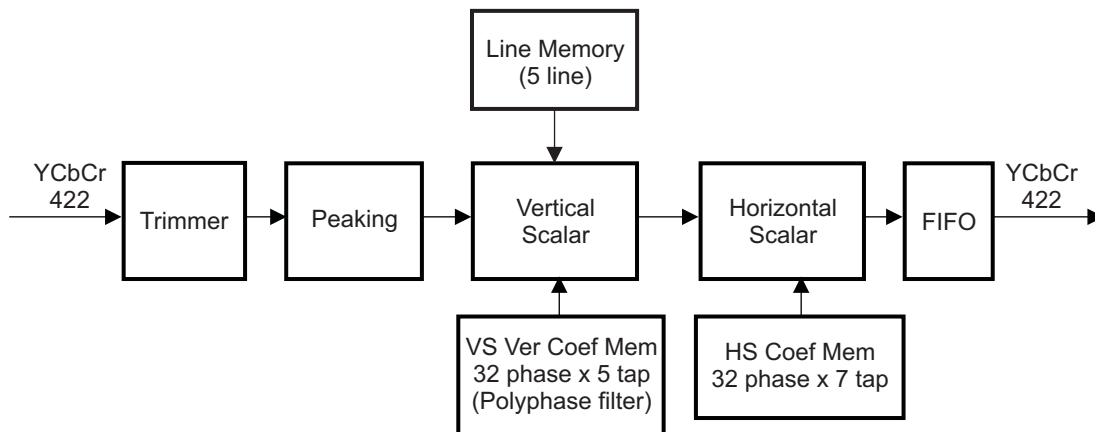

The SC is used in the video path and in all other video write-back data paths in the VPE module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 10-19. SC Block Diagram

10.3.4.2.1 Trimmer

The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through [VPE_CFG_SC25\[26:16\] CFG_OFF_W](#) and [VPE_CFG_SC25\[10:0\] CFG_OFF_H](#) registers.

Width and height are set through [VPE_CFG_SC24\[26:16\] CFG_ORG_W](#) and [VPE_CFG_SC24\[10:0\] CFG_ORG_H](#) registers.

Figure 10-20. Input Image Trimming

NOTE: Width and height of the source image are global parameters and are set with [VPE_CFG_SC5\[22:12\]](#) CFG_SRC_W and [VPE_CFG_SC5\[10:0\]](#) CFG_SRC_H registers.

It is required that the input image frame ($CFG_SRC_W \times CFG_SRC_H$) to be at least 32×32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

10.3.4.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in [Figure 10-21](#), the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in [Figure 10-21](#).

Figure 10-21. Filter Implementation and Parameter Description

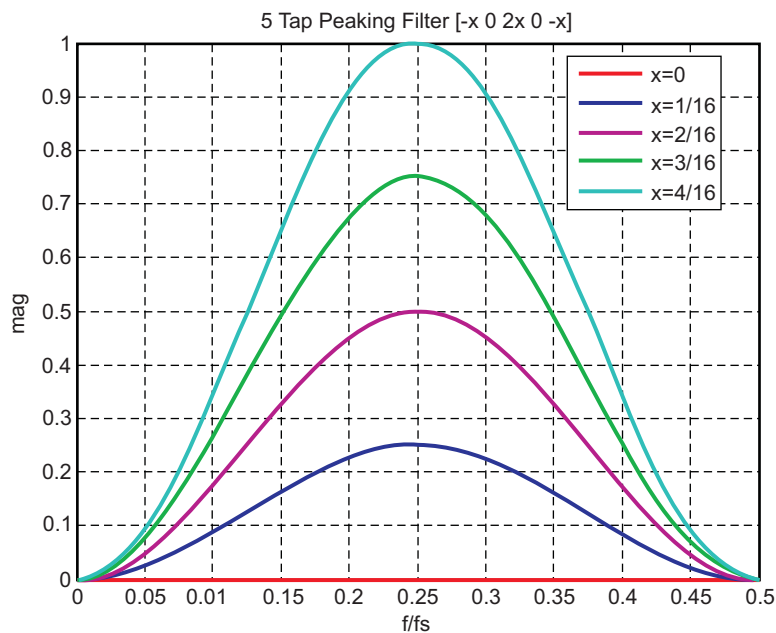

vip-057

Table 10-4. Parameter Description

Parameter	Description	Bits	Default
VPE_CFG_SC19[7:0] CFG_HPF_COEF0 to VPE_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]
VPE_CFG_SC20[18:16] CFG_HPF_NORM_SHIFT	Right shift	3	4
VPE_CFG_SC21[8:0] CFG_NL_LO_THR	Coring threshold	9	16
VPE_CFG_SC22[8:0] CFG_NL_HI_THR	High threshold	9	400
VPE_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope = - CFG_NL_LO_SLOPE/16	8	16
VPE_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG_NL_HI_SLOPE_SHIFT-3)}$	3	4
VPE_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VPE_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

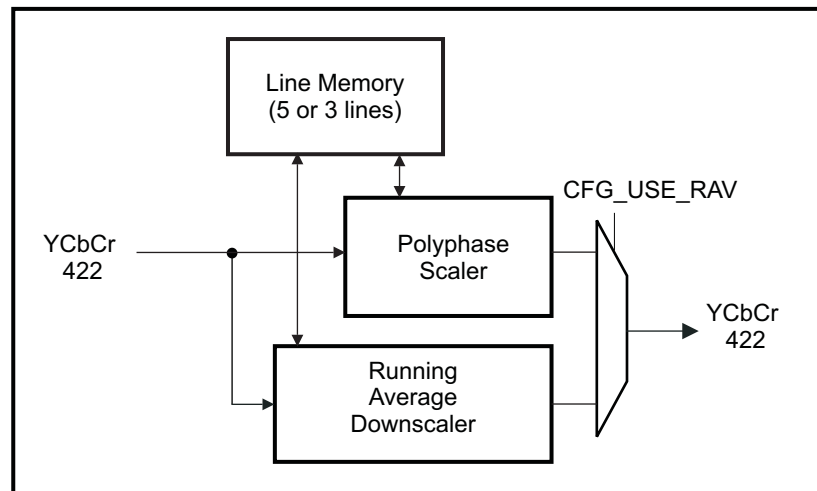

Parameters for the Peaking filters are defined in VPE_CFG_SC19 through VPE_CFG_SC22 registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in Figure 10-22. If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

Figure 10-22. Peaking Filter at fs/4

10.3.4.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase x 5-tap) filter and a running average filter as shown in Figure 10-23. While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a 1/2 or less size. Selection between these two scalers is based on the user setting of VPE_CFG_SC0[4] CFG_USE_RAV parameter (CFG_USE_RAV= '0' for poliphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Figure 10-23. Vertical Scaler Block Diagram

10.3.4.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VPE, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

10.3.4.2.3.2 Vertical Scaler Configuration Parameters

Table 10-5. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VPE_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace
VPE_CFG_SC0[0] CFG_INTERLACE_O			0 = progressive 1 = interlace
VPE_CFG_SC0[3] CFG_INV_T_FID			Invert field ID input
VPE_CFG_SC0[4] CFG_USE_RAV		Scaler Mode	0 = use polyphase scaler 1 = use running average scaler
VPE_CFG_SC1[26:0] CFG_ROW_ACC_INC		Bilinear & Polyphase Scalers	For progressive in/progressive out: $\text{round}(2^{16} \cdot (\text{srcH} - 1) / (\text{tarH} - 1))$ For progressive_in/interlace_out: $\text{round}(2^{16} \cdot 2 \cdot (\text{srcH} - 1) / (2 \cdot \text{tarH} - 1))$ For interlace_in/progressive_out: $\text{round}(2^{16} \cdot (2 \cdot \text{srcH} - 1) / (2 \cdot (\text{tarH} - 1)))$ For interlace_in/interlace_out: $\text{round}(2^{16} \cdot (2 \cdot \text{srcH} - 1) / (2 \cdot \text{tarH} - 1))$ For interlace in/out, srcH/tarH are number of field lines as specified in VPE_CFG_SC4/VPE_CFG_SC5 descriptions.
VPE_CFG_SC2[27:0] CFG_ROW_ACC_OFFSET	0		Initial row accumulator value for progressive frame and top field
VPE_CFG_SC3[27:0] CFG_ROW_ACC_OFFSET_B	0		Initial row accumulator value for bottom field
VPE_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR	4	Bilinear Scaler	Range for chroma soft switch based on pixel differences (max limit = 8)

Table 10-5. Vertical Scaler Configuration Parameters (continued)

Parameter	Typical Value	Controls	Description
VPE_CFG_SC13[21:12] CFG_CHROMA_INTP_THR	64		Threshold used in chroma soft switch based on pixel differences
VPE_CFG_SC13[9:0] CFG_SC_FACTOR_RAV		Running Average Scaler	Scale factor = round(1024 × tarH/srcH)
VPE_CFG_SC6[9:0] CFG_ROW_ACC_INIT_RAV			Initial row accumulator value for progressive frame and top field
VPE_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

10.3.4.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase × 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the mod_scale_factor calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```

if (scale_factor >= 1/2) {
    mux=0; mod_scale_factor=scale_factor;
} else if (scale_factor >= 1/4) {
    mux=1; mod_scale_factor=2*scale_factor;
} else {
    mux=2; mod_scale_factor=4*scale_factor;
}

```

Figure 10-24. Horizontal Scaler Block Diagram

In auto mode (CFG_AUTO_HS = '1'), scaler will operate as per above recommendation. In addition to this, for (CFG_AUTO_HS = '1'), polyphase filtering will be bypassed when (scale_factor = '1') or (scale_factor = 1/2) or (scale_factor == 1/4). If CFG_AUTO_HS = '0' is used, user must provide proper values for dcm_2x, dcm_4x, proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64x64 to 2047x2047.

10.3.4.2.4.1 Half Decimation Filter

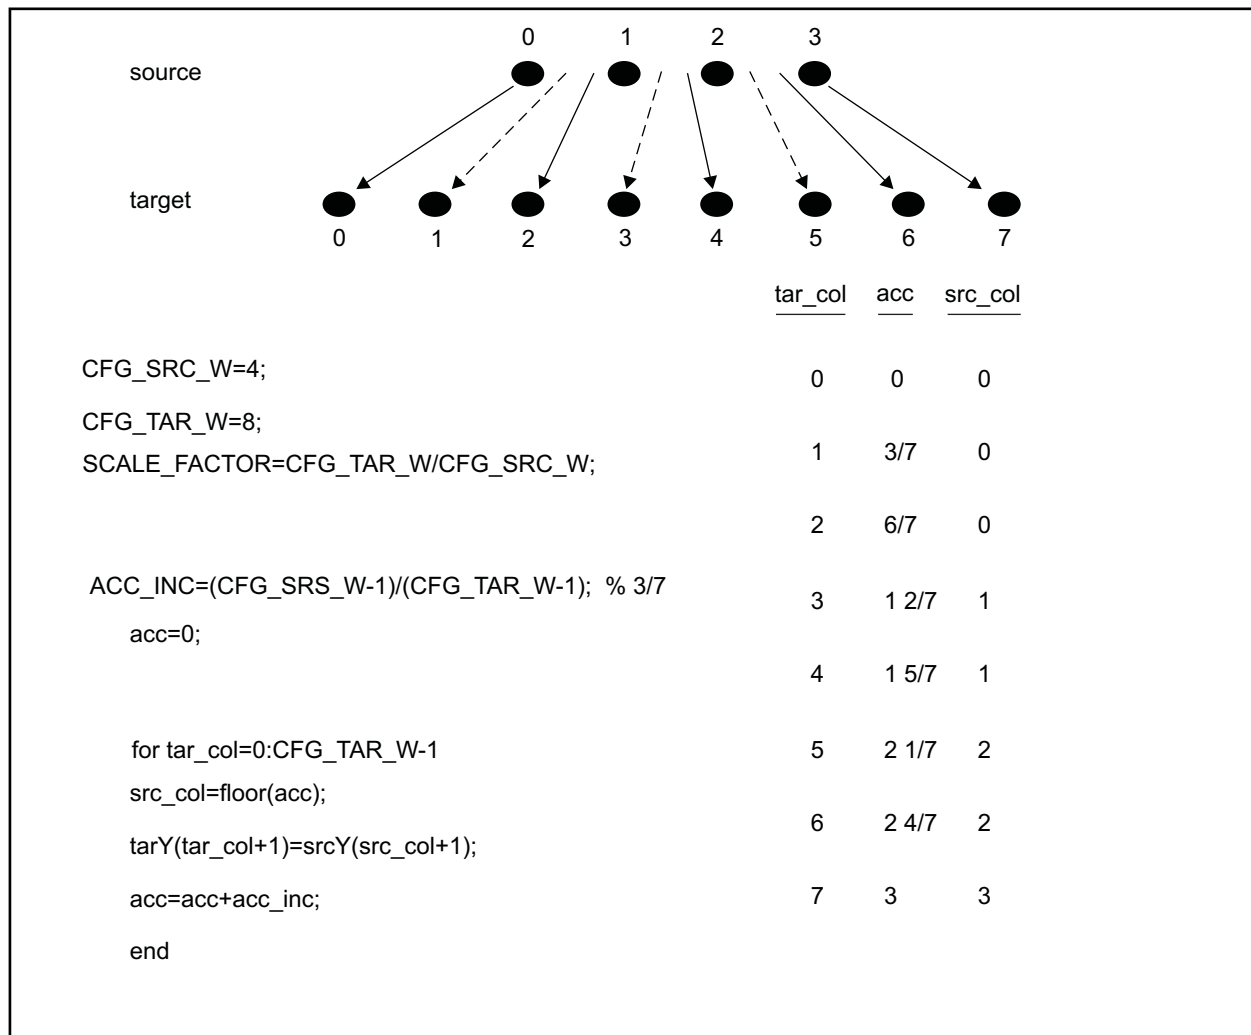

The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

10.3.4.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 10-25 shows an up-scaling example.

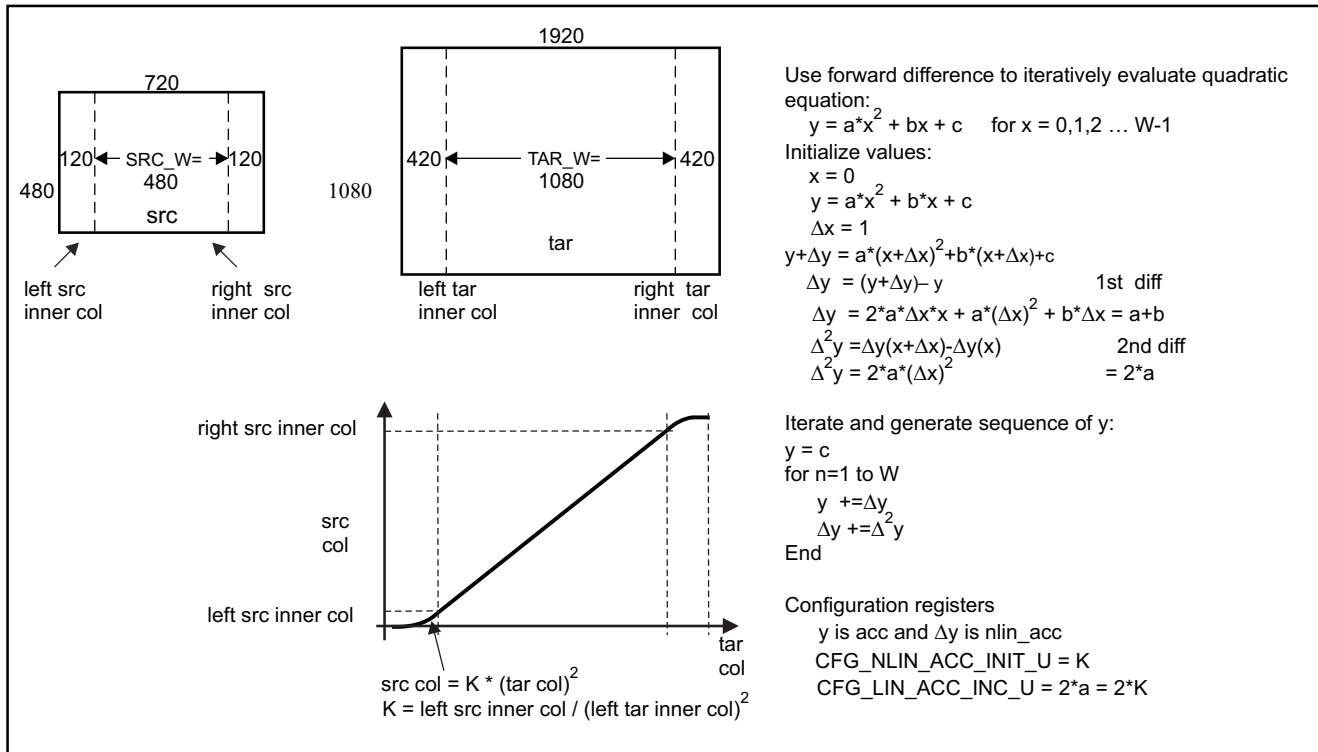

Figure 10-25. Polyphase Filtering Example

10.3.4.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 x 3 picture and fetching it as a 16 x 9 to memory. Non-linear scaling parameters are set with VPE_CFG_SC4[30:28] CFG_NLIN_ACC_INIT_U and VPE_CFG_SC4[26:24] CFG_LIN_ACC_INC_U registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. Figure 10-26 shows a non-linear scaling case.

Figure 10-26. Non-linear Scaling Example

10.3.4.2.4.4 Horizontal Scaler Configuration Registers

10.3.4.2.6 Coefficient Memory

10.3.4.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMs prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

10.3.4.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases × 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in [Figure 10-27](#), and 224 coefficient values are stored in each SRAM.

Figure 10-27. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases × 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in [Figure 10-28](#).

Figure 10-28. SRAM Layout for 5tap Coefficient

Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

10.3.4.2.6.3 Scaler Coefficients Packing on 128-bit VPI Control I/F

A coefficient value is 13 bits wide and takes a single half word. Thus, one VPI Control write carries one phase's worth of coefficients. The last half-word in a quad-word is not used for 7tap coefficients.

Figure 10-29. VPI Control I/F Coef Data Format (7tap)

The Vertical Polyphase scaler coefficients have only five or three values per phase, so the last three (or five) entries are unused. The Vertical Polyphase coefficient packing is shown in Figure 10-30 and Figure 10-31.

Figure 10-30. VPI Control I/F Coef Data Format (5tap)

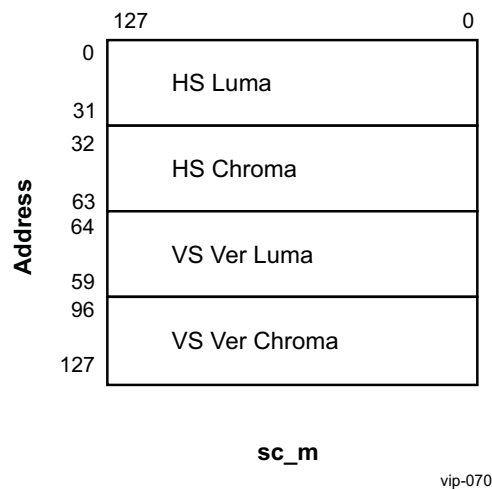

Figure 10-31. VPI Control I/F Coef Data Format (3tap)

10.3.4.2.6.4 VPI Control I/F Memory Map for Scaler Coefficients

The memory map of the VPI Control I/F for the Scaler coefficients is shown in Figure 10-32. All coefficients can be filled up by a single VPI Control write command. The update address feature of VPI Control I/F enables individual access to a certain location of memories.

Figure 10-32. VPI Control I/F Memory Map (Write)

The module supports the VPI Control Read to read back the contents in the coefficient memories for debug purpose. Figure 10-33 shows the memory map of the VPI Control Read. As the VPI Control Read has only 32 bit data bus, it requires the word addressing while the write does the quad-word addressing.

Figure 10-33. VPI Control I/F Memory Map (Read)

10.3.4.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

10.3.4.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. [Table 10-11](#) provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in [Section 10.3.4.4](#).

Table 10-11. Coefficient Data Files

Scaler	Scale Factor	Coeff table
HS Polyphase Filter	All upscaling	Section 10.3.4.4.1.1, ppfcoef_scael_eq_1_32_phases_flip.dat
	½ or ¼ down scaling	Section 10.3.4.4.1.1, ppfcoef_scale_eq_1_32_phases_flip.dat
	> 15/16	Section 10.3.4.4.1.9, ppfcoef_scale_eq_15div16_32_phases_flip.dat
	> 14/16	Section 10.3.4.4.1.8, ppfcoef_scale_eq_14div16_32_phases_flip.dat
	> 13/16	Section 10.3.4.4.1.7, ppfcoef_scale_eq_13div16_32_phases_flip.dat
	> 12/16	Section 10.3.4.4.1.6, ppfcoef_scale_eq_12div16_32_phases_flip.dat
	> 11/16	Section 10.3.4.4.1.5, ppfcoef_scale_eq_11div16_32_phases_flip.dat
	> 10/16	Section 10.3.4.4.1.4, ppfcoef_scale_eq_10div16_32_phases_flip.dat
	> 9/16	Section 10.3.4.4.1.3, ppfcoef_scale_eq_9div16_32_phases_flip.dat
> 8/16	Section 10.3.4.4.1.2, ppfcoef_scale_eq_8div16_32_phases_flip.dat⁽¹⁾	

⁽¹⁾ HS Scaler has two sets of ½ decimator to perform downscaling ratios below ½ and ¼.

10.3.4.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

- VPE_CFG_SC0[3] CFG_INV_T_FID = 0 (Field ID will be used without inversion)
- VPE_CFG_SC0[5] CFG_ENABLE_EV = 1 (Field ID will be used without inversion)
- VPE_CFG_SC0[6] CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)
- VPE_CFG_SC0[7] CFG_DCM_2X = 0 (The 2X decimation filter is disabled)
- VPE_CFG_SC0[8] CFG_DCM_4X = 0 (The 4X decimation filter is disabled)
- VPE_CFG_SC0[11] CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)
- VPE_CFG_SC0[14] CFG_Y_PK_EN = 0 (Luma peaking is disabled)
- VPE_CFG_SC0[15] CFG_TRIM= 1 (Trimming is enabled)
- VPE_CFG_SC12[24:0] CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)
- VPE_CFG_SC13[21:12] CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)
- VPE_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR = 4 (max limit=8)

VPE_CFG_SC18[24:16] CFG_CONF_DEFAULT = 0x100 (Defines confidence factor when edge detection is disabled (VPE_CFG_SC0[5] CFG_ENABLE_EV bit = 0))

VPE_CFG_SC19 = 0xFC000000

VPE_CFG_SC20 = 0x0C840800

VPE_CFG_SC21 = 0x00100010

VPE_CFG_SC22 = 0x00040190

10.3.5 VPE Color Space Converter (CSC)

The color space converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

10.3.5.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

10.3.5.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

$$\begin{aligned} Y &= A0 * R + B0 * G + C0 * B + D0 \\ Cb &= A1 * R + B1 * G + C1 * B + D1 \\ Cr &= A2 * R + B2 * G + C2 * B + D2 \end{aligned}$$

Color space coefficients are set through the following registers:

- For luma component:
 - VPE_CSC00[12:0] A0
 - VPE_CSC00[28:16] B0
 - VPE_CSC01[28:16] C0
 - VPE_CSC04[27:16] D0
- For Cb component:
 - VPE_CSC01[28:16] A1
 - VPE_CSC02[12:0] B1
 - VPE_CSC02[27:16] C1
 - VPE_CSC05[11:0] D1
- For Cr component :
 - VPE_CSC03[12:0] A2
 - VPE_CSC03[27:16] B2
 - VPE_CSC04[12:0] C2
 - VPE_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in [Figure 10-34](#).

Figure 10-34. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

10.3.5.2.1 HDTV Application

10.3.5.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 10-35. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 10-36. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

10.3.5.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 10-37. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.1826 & 0.6142 & 0.0620 \\ -0.1006 & -0.3385 & 0.4392 \\ 0.4392 & -0.3990 & -0.0402 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 10-38. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1644 & -0.0003 & 1.7927 \\ 1.1644 & -0.2132 & -0.5329 \\ 1.1642 & 2.1125 & -0.0001 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -248 \\ 77 \\ -289 \end{bmatrix} D$$

10.3.5.2.1.3 Quantized Coefficients for Color Space Converter in HDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for HDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Table 10-12. Quantized Coefficients of HDTV Application with Video Data Range

10.3.5.2.2 SDTV Application

10.3.5.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 10-39. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

$$\begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} = \begin{bmatrix} 1 & -0.0003 & 1.3717 \\ 1 & -0.3365 & -0.6984 \\ 1 & 1.7336 & -0.0016 \end{bmatrix} \begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} + \begin{bmatrix} -176 \\ 132 \\ -222 \end{bmatrix} D$$

10.3.5.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- R_d , G_d , B_d , Y_d , C_b and C_r will be the range [0-255]
- $D = 1$

In a 10-bit system:

- R_d , G_d , B_d , Y_d , C_b and C_r will be in the range [0-1023]
- $D = 4$

Conversion from RGB to YCbCr:

Figure 10-41. Conversion from RGB to YCbCr

$$\begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 10-42. Conversion from YCbCr to RGB

$$\begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} = \begin{bmatrix} 1.1641 & -0.0018 & 1.5958 \\ 1.1641 & -0.3914 & -0.8135 \\ 1.1641 & 2.0178 & -0.0012 \end{bmatrix} \begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} + \begin{bmatrix} -223 \\ 136 \\ -277 \end{bmatrix} D$$

10.3.5.2.2.3 Quantized Coefficients for Color Space Converter in SDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for SDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

10.3.5.3 CSC Bypass Mode

CSC module can be bypassed by setting `VPE_CSC05[28]` BYPASS bit-field to 1.

10.3.6 VPE Chroma Up-Sampler (CHR_US)

The chroma up-sampler (CHR_US) module is used to convert from YCbCr 4:2:0 data format input to YCbCr 4:2:2 format output.

10.3.6.1 Features

- Supports both interlaced and progressive inputs
- 4-tap interpolation filtering
- Filter coefficients are all programmable
- Four sets of coefficients (each set has four coefficients) corresponding to anchor pixels and interpolated pixels of top field and bottom field
- For progressive inputs, the coefficients corresponding to top and bottom field must be identical
- Each coefficient is 14 bit (4.10 format)
- Default filter coefficients are based on Catmull-Rom algorithm
- Capable of removing the half pel vertical offset so all chroma samples are on-grid. This step ensures that the output does not suffer from any kind of rainbow effect due to chroma-upsampling.
- Provides a 10-bit interface in both directions: 10-bit input and 10-bit output
- Support bypass mode for 4:2:2 input

10.3.6.2 Functional Description

The YUV420 input to Chroma Upsampler module must be in the format shown in [Figure 10-43](#), in which the chroma sample lies in the left column of a 2x2 pixel block with half pel vertical shift.

Figure 10-43. 4:2:0 YCrCb Color Space with Chroma Left-aligned

The upsampling is performed by an interpolation filter which uses Catmull-Rom algorithm. The Catmull-Rom Filter is based on four anchor pixels representing a four tap filter. The general 4-tap filter Catmull-Rom filter is defined in [Figure 10-44](#).

Figure 10-44. 4:2:0 YCrCb Color Space with Chroma Left-aligned

$$[1 \ x \ x^2 \ x^3] * \begin{bmatrix} 0 & 1 & 0 & 0 \\ -a & 0 & a & 0 \\ 2a & -3+a & 3-2a & -a \\ -a & 2-a & -(2-a) & a \end{bmatrix}$$

In the previous figure, x is the distance to the interpolated point between the two anchor points. In [Figure 10-45](#), the example shows the desired interpolated point to be 1/4 of the distance between Anchor0 and Anchor1. Thus, $x = 1/4$.

Figure 10-45. 4:2:0 YCrCb Color Space with Chroma Left-aligned

The variable 'a' determines the characteristics of the filter. $a = 1/2$ is generally used because the filter will produce an interpolated output that is an exact match to a linear input curve. In the literature, some people have noted that $a=0.75$ or $a=1.0$ may be more pleasing to the eye. In the implementation, the filter coefficients are programmable through MMR.

For the interpolated pixel, the variable x defines the positional offset relative to anchor pixel1. [Figure 10-46](#) shows four anchor pixels with Anchor0 being near the top of the image and Anchor3 near the bottom. x is relative to Anchor1. Positive values of x goes down towards Anchor3. Negative x values imply a direction towards Anchor0. For example, if we want to interpolate a pixel midway between Anchor1 and Anchor2, x would be $2/4=1/2$. There are four half pels between Anchor1 and Anchor2. Midway is two pels, so $x=2/4$.

Figure 10-46. Anchor Pixels

In the implementation, we need to interpolate the anchor pixel to get it on-grid. Then, we also need to interpolate a completely new pixel for YPrPb 4:2:2.

For a progressive input, $x = -1/4$ for getting the anchor pixel on-grid. $x = 1/4$ for generating the new pixel.

Lines are scanned from the top of the picture to the bottom.

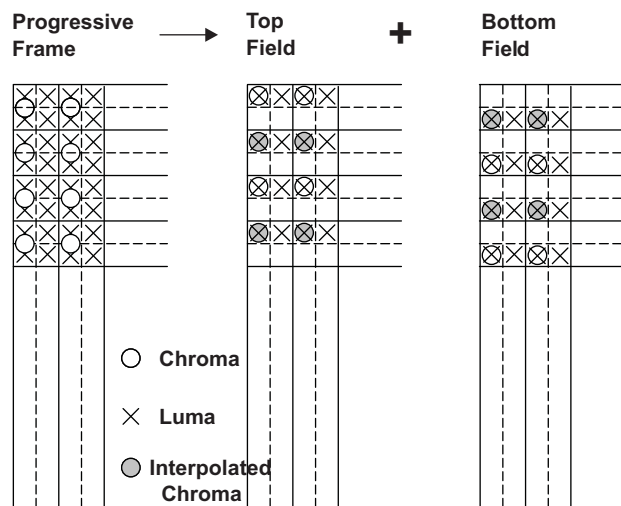

10.3.6.3 For Interlaced YUV420 Input Data

Figure 10-47 shows how 4:2:0 video is split into top and bottom fields in interlaced format. Chroma is attached to alternating Luma lines in the top and bottom fields such that color is equally spread out between the top field and the bottom field. This 4:2:0 interlaced chroma representation is shown in the following figure.

In each interlaced field, the chroma anchor points are separated by 4 pixel lines, or 8 half pels. The 4:2:2 chroma interpolated color space representation of interlaced pictures is shown in Figure 10-48.

Figure 10-48. Ideal 4:2:2 Chroma Upsampling for Interlaced Scan

Following interpolation, the chroma samples lie on a 4:2:2 grid.

Anchor pixels for the top field have been sited up by half a pel ($x = -1/8$). The new interpolated pixel is sited 3 half pels ($x=3/8$) down. Samples from the top field are distinct from samples in the bottom field.

For the bottom field, anchor pixels are sited 3 half pels up ($x = -3/8$). The new interpolated pixel is sited 1 half pel down ($x=1/8$).

The chroma upsampling filter accepts different coefficients for the top field and the bottom field. In the case of progressive input, the coefficients for the top field and bottom field must be the same.

It should be noted that a different implementation could have been chosen to use the same coefficients for the top and bottom fields. Instead of pushing pixels from the top to bottom of a picture, it can be shown that pushing the bottom field through the upsampling filter from the bottom to the top of the picture permits using the same values for x as in the top field case.

10.3.6.4 Edge Effects

Several methods with increasing levels of difficulty resulting in increasing quality can be employed to deal with chroma pixels near the edges. In this module, the edge pixels can be mathematically approximated using the same filter as the rest of the picture. Edge pixels are duplicated going into the filter.

10.3.6.5 Modes of Operation (VPDMA)

In both primary (PRI) and auxiliary (AUX) paths, the mode in which the VPDMA needs to be operated depends whether the chroma upsampler and de-interlacers are enabled or not. Table 1-12 shows the modes of operation.

Table 10-16. VPDMA Modes of Operation

Mode A	Mode B
Input data is 4:2:0	Input data is 4:2:2

These modes need to be set in the following register bit-fields of particular instances being used:

[VPE_REG0\[17:16\] CFG_MODE](#)

LINE_MODE bitfield in VPDMA registers of format RD_LB_CLIENT_CTL_STATUS need to be configured as follows:

Mode A corresponds to MMR value 0

Mode B corresponds to MMR value 1

The following are the VPDMA client related bit-fields that need to be configured:

[VPE_PRI_CHROMA_CSTAT\[9:8\] LINE_MODE](#)

[VPE_PRI_FLD1_CHROMA_CSTAT\[9:8\] LINE_MODE](#)

[VPE_PRI_FLD2_CHROMA_CSTAT\[9:8\] LINE_MODE](#)

-
- NOTE:**
1. For VPDMA luma clients, Mode B should always be used.
 2. For VPDMA chroma clients, Mode A is used for 420 data and Mode B is used for 422 data.
-

10.3.6.6 Coefficient Configuration

The filter coefficients are left-aligned 14-bit binary values in signed Q4.10 format. The decimal point is between bits 9 and 10 using the convention of the least significant bit being at position zero. The most significant bit, 13, is the sign bit.

In the register map, the most significant nibble of the coefficient is the sign and the integer portion of the value. The next 10 bits represent the fractional portion of the coefficient value.

Chroma upsampling requires two sets of coefficients. Each coefficient set is comprised of four 14-bit Q4.10 values. One set is used for the top field of an interlaced picture, and the other set is used for the bottom field of an interlaced picture. For a progressive picture, both sets must be identical.

The coefficients and settings should be used for the following video source types:

4:2:2 input (progressive or interlaced input)

VPDMA line mode = 1

[VPE_REG0\[17:16\] CFG_MODE](#) = 0x1 (mode B)

CHR_US coefficients are not used in this mode, so values are "don't care"

4:2:0 input (interlaced input):

VPDMA line mode = 0

VPE_REG0[17:16] CFG_MODE = 0x0 (mode A)

VPE_REG0[31:18] ANCHOR_FID0_C0 = 0x51

VPE_REG0[15:2] ANCHOR_FID0_C1 = 0x3d5

VPE_REG1[31:18] ANCHOR_FID0_C2 = 0x3fe3

VPE_REG1[15:2] ANCHOR_FID0_C3 = 0x3ff7

VPE_REG2[31:18] INTERP_FID0_C0 = 0x3fb5

VPE_REG2[15:2] INTERP_FID0_C1 = 0x2e9

VPE_REG3[31:18] INTERP_FID0_C2 = 0x18f

VPE_REG3[15:2] INTERP_FID0_C3 = 0x3fd3

VPE_REG4[31:18] ANCHOR_FID1_C0 = 0x16b

VPE_REG4[15:2] ANCHOR_FID1_C1 = 0x247

VPE_REG5[31:18] ANCHOR_FID1_C2 = 0xb1

VPE_REG5[15:2] ANCHOR_FID1_C3 = 0x3f9d

VPE_REG6[31:18] INTERP_FID1_C0 = 0x3fcf

VPE_REG6[15:2] INTERP_FID1_C1 = 0x3db

VPE_REG7[31:18] INTERP_FID1_C2 = 0x5d

VPE_REG7[15:2] INTERP_FID1_C3 = 0x3ff9

4:2:0 input (progressive input):

VPDMA line mode = 0

VPE_REG0[17:16] CFG_MODE = 0x0 (mode A)

VPE_REG0[31:18] ANCHOR_FID0_C0 = 0x00C8

VPE_REG0[15:2] ANCHOR_FID0_C1 = 0x0348

VPE_REG1[31:18] ANCHOR_FID0_C2 = 0x0018

VPE_REG1[15:2] ANCHOR_FID0_C3 = 0x3fd8

VPE_REG2[31:18] INTERP_FID0_C0 = 0x3fb8

VPE_REG2[15:2] INTERP_FID0_C1 = 0x0378

VPE_REG3[31:18] INTERP_FID0_C2 = 0x00e8

VPE_REG3[15:2] INTERP_FID0_C3 = 0x3fe8

VPE_REG4 to VPE_REG7 are not used so their values are "don't care".

10.3.7 VPE Chroma Down-Sampler (CHR_DS)

When the picture input is 4:2:2, the chroma must be downsampled to 4:2:0 before it is stored into DRAM for later compression by the imaging subsystem. The downsampling is performed by an averaging filter.

An array with chroma samples must be used- $C_{IN}[i]$ with range from 0 to N-1. ($C_{IN}[0]$ is the topmost chroma sample and $C_{IN}[N-1]$ is bottom chroma sample) .

The output array C_{OUT} (ranging from 0 to N/2 - 1) is calculated by the following formula:

$$C_{OUT}[i] = \text{CLIP}[(C_{IN}[2i] + C_{IN}[2i+1]) / 2] \text{CLIP}[x] \quad (x = 0 \text{ to } 255).$$

This filter performs simple averaging of two input lines into one output line.

10.3.8 VPE YUV422 to YUV444 Conversion

As shown on [Figure 10-2](#), prior the CSC the video format needs to be converted from YUV422 to YUV444 format. This conversion only applies to the Chroma samples in the color space, and is implemented using a 4-tap Catmull-Rom algorithm using the following equations:

$$C_{OUT}[2*i] = C_{IN}[i] \quad C_{OUT}[2*i+1] = \text{CLIP} (9/16*C_{IN}[i] + 9/16*C_{IN}[i+1] - 1/16*C_{IN}[i-1] - 1/16*C_{IN}[i+2] + 1)$$

NOTE: Edge effects are treated by repeating the first and last pixel per line.

10.3.9 VPE Video Port Direct Memory Access (VPDMA)

10.3.9.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

10.3.9.2 VPDMA Basic Definitions

10.3.9.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VPE) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

10.3.9.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports four types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.
- **Free Channel** - Used in video compositions. The Free channel data type is always ignored as it uses the same data type of the descriptor that first calls the free channel.

10.3.9.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports two types of lists: a Regular List and a Self-Modifying List.

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the [VPE_LIST_ADDR](#) register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the LIST_ATTR register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to [VPE_LIST_ADDR](#) register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the list_attr.rdy bit after the firmware loading is complete.

10.3.9.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more information see [Section 10.3.9.8, VPDMA Data Formats](#).

- RGB Data Types:
 - RGB16-565
 - ARGB-1555
 - ARGB-4444
 - RGBA-5551
 - RGBA-4444
 - ARGB24-6666
 - RGB24-888
 - ARGB32-8888
 - RGBA24-6666
 - RGBA32-8888
- YUV Data Types:
 - Y 4:4:4
 - Y 4:2:2
 - Y 4:2:0
 - C 4:4:4
 - C 4:2:2
 - C 4:2:0
 - CY 4:2:2
 - YCbC 4:4:4
 - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

10.3.9.3 VPDMA Client Buffering and Functionality

Table 10-17 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 10-17. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features
dei_hq_1_chroma	hq_vid1_chroma	1920 (color separate) 960 (interleaved)	1920 (color separate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_1_luma	hq_vid1_luma	1920 (color separate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_2_luma	hq_vid2_luma	1920 (color separate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_2_chroma	hq_vid2_chroma	1920 (color separate) 960 (interleaved)	1920 (color separate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_3_luma	hq_3_luma	1920 (color separate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_3_chroma	hq_3_chroma	1920 (color separate) 960 (interleaved)	1920 (color separate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_mv_in	hq_mv_in	Tiled Data Not Supported	4096	
dei_hq_mv_out	hq_mv_out	Tiled Data Not Supported	4096	
vip1_up_y	vip1_porta_luma vip1_porta_rgb	1920 (color separate) 960 (interleaved)	4096	TILED
vip1_up_uv	vip1_porta_chroma	1920 (color separate) 960 (interleaved)	4096	TILED

10.3.9.4 VPDMA Channels Assignment

Table 10-18 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer descriptor. The Client field states the name of the Client and in parentheses it states the reference number in Figure 10-2, VPE Block Diagram.

Table 10-18. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
hq_vid1_luma	High Quality DEI Video 420 Luma Data/ 422 Interleaved Data	0	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_1_luma (7)
hq_vid1_chroma	High Quality DEI Video 420 Chroma Data	1	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_1_chroma (7)
hq_vid2_luma	Low Cost DEI Field Minus 1420 Luma Data	2	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_2_luma (8)
hq_vid2_chroma	Low Cost DEI Field Minus 1 420 Chroma Data	3	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_2_chroma (8)

Table 10-18. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
hq_vid3_luma	Low Cost DEI Field Minus 2 420 Luma Data	4	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_3_luma (9)
hq_vid3_chroma	Low Cost DEI Field Minus 2 420 Chroma Data	5	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_3_chroma (9)
hq_mv	Low Cost DEI Motion Vector	12	OTHER (4)	dei_hq_mv_in (6)
hq_mv_out	Low Cost DEI Motion Vector Write	15	OTHER (4)	dei_hq_mv_out (6)
vip1_porta_luma	Video Input 1 Port A 420 Data Luma	102	YUV (0x1, 0x2,0x7)	vip1_up_y (1)
vip1_porta_chroma	Video Input 1 Port A 420 Data Chroma	103	YUV (0x5,0x6,0x7)	vip1_up_uv (1)
vip1_porta_rgb	Video Input 1 Port A RGB Data	106	RGB (0x0-0x8)	vip1_up_y (1)

10.3.9.5 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each separate interrupt group. A status register bit exists for each interrupt source for for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

Table 10-19 shows all interrupt events from the VPDMA that go to VPE top level. The interrupt events are mapped to one interrupt line, INT0, that go to VPE top level.

Table 10-19. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VPE_INT0_CHANNEL0_INT_STAT	VPE_INT0_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 has fired.
vpdma_int_channel_group1	VPE_INT0_CHANNEL1_INT_STAT	VPE_INT0_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 has fired.
vpdma_int_channel_group2	VPE_INT0_CHANNEL2_INT_STAT	VPE_INT0_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 has fired.
vpdma_int_channel_group3	VPE_INT0_CHANNEL3_INT_STAT	VPE_INT0_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 has fired.
vpdma_int_channel_group4	VPE_INT0_CHANNEL4_INT_STAT	VPE_INT0_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 has fired.

Table 10-19. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description		
vpdma_int_channel_group5	VPE_INT0_CHANNEL5_INT_STAT	VPE_INT0_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 has fired.		
vpdma_int_list0_complete vpdma_int_list0_notify	VPE_INT0_LIST0_INT_STAT	VPE_INT0_LIST0_INT_MASK	List 0 has completed The data transfer in list 0 with the Notify Field set in the descriptor has completed		
vpdma_int_list1_complete vpdma_int_list1_notify			List 1 has completed The data transfer in list 1 with the Notify Field set in the descriptor has completed		
vpdma_int_list2_complete vpdma_int_list2_notify			List 2 has completed The data transfer in list 2 with the Notify Field set in the descriptor has completed		
vpdma_int_list3_complete vpdma_int_list3_notify			List 3 has completed The data transfer in list 3 with the Notify Field set in the descriptor has completed		
vpdma_int_list4_complete vpdma_int_list4_notify			List 4 has completed The data transfer in list 4 with the Notify Field set in the descriptor has completed		
vpdma_int_list5_complete vpdma_int_list5_notify			List 5 has completed The data transfer in list 5 with the Notify Field set in the descriptor has completed		
vpdma_int_list6_complete vpdma_int_list6_notify			List 6 has completed The data transfer in list 6 with the Notify Field set in the descriptor has completed		
vpdma_int_list7_complete vpdma_int_list7_notify			List 7 has completed The data transfer in list 7 with the Notify Field set in the descriptor has completed		
vpdma_int_client			VPE_INT0_CLIENT0_INT_STAT VPE_INT0_CLIENT1_INT_STAT	VPE_INT0_CLIENT0_INT_MASK VPE_INT0_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor			VPE_INT0_LIST0_INT_STAT	VPE_INT0_LIST0_INT_STAT	Descriptor Interrupt

In [Table 10-19](#) above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group,” “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to [Table 10-20](#) to determine what the actual interrupt was).

Table 10-20. VPE Interrupt Sources

Interrupt	Interrupt Group	Description
channel_hq_mv	channel_group0	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager.
channel_hq_mv_out	channel_group0	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager.
channel_hq_vid1_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid1_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid2_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid2_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid3_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid3_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.

Table 10-20. VPE Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_dei_hq_1_chroma	client	The client interface dei_hq_1_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_1_luma	client	The client interface dei_hq_1_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_2_chroma	client	The client interface dei_hq_2_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_2_luma	client	The client interface dei_hq_2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_3_chroma	client	The client interface dei_hq_2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_3_luma	client	The client interface dei_hq_3_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_mv_in	client	The client interface dei_hq_mv_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_mv_out	client	The client interface dei_hq_mv_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.

Table 10-20. VPE Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed and a new list can be loaded.
list0_notify	list0_notify	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel.
list1_complete	list1_complete	List 1 has completed and a new list can be loaded.
list1_notify	list1_notify	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel.
list2_complete	list2_complete	List 2 has completed and a new list can be loaded.
list2_notify	list2_notify	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel.
list3_complete	list3_complete	List 3 has completed and a new list can be loaded.
list3_notify	list3_notify	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel.
list4_complete	list4_complete	List 4 has completed and a new list can be loaded.
list4_notify	list4_notify	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel.
list5_complete	list5_complete	List 5 has completed and a new list can be loaded.
list5_notify	list5_notify	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel.
list6_complete	list6_complete	List 6 has completed and a new list can be loaded.
list6_notify	list6_notify	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel.
list7_complete	list7_complete	List 7 has completed and a new list can be loaded.
list7_notify	list7_notify	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel.
other		Any channel that is not assigned to a specific client has completed.

10.3.9.6 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

- i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.
- ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller
- iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

10.3.9.6.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 10-49. Inbound Data Transfer Descriptor Format

	31:24			23:16				15:8		7:0

The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8 × 32bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

10.3.9.6.1.1 Data Packet Descriptor Word 0 (Data)

Table 10-21. Data Packet Descriptor Word 0 Field Descriptions

Bit	Field	Value	Description
31:26	Data Type		Miscellaneous Channel Sets the pixel size in bits plus 1
			RGB Channel
		0	RGB16-565
		1h	ARGB-1555
		2h	ARGB-4444
		3h	RGBA-5551
		4h	RGBA-4444
		5h	ARGB24-6666
		6h	RGB24-888
		7h	ARGB32-8888
		8h	RGBA24-6666
		9h	RGBA32-8888
		10h	BGR16-565
		11h	ABGR-1555
		12h	ABGR-4444
		13h	BGRA-5551
		14h	BGRA-4444
		15h	ABGR24-6666
		16h	BGR24-888
		17h	ABGR32-8888
		18h	BGRA24-6666
		19h	BGRA32-8888
			YUV Channel
		0	Y 4:4:4
		1	Y 4:2:2
		2	Y 4:2:0
		4	C 4:4:4
		5	C 4:2:2
		6	C 4:2:0
		7	CY 4:2:2
		8	YCbC 4:4:4
		14h	Cb 4:4:4
		15h	Cb 4:2:2
16h	Cb 4:2:0		
17h	CbY 4:2:2		
27h	YC 4:2:2		
37h	YCb 4:2:2		
25	Notify	0-1	Send List Notification Interrupt upon last transfer of this channel
24	Field	0-1	Field Value
23	1D	0-1	The transfer is one dimensional. The transfer and frame sizes are combined to make a single 32 bit transfer size. For writes this value is passed to the generated descriptor. This feature is not supported by all clients. Only clients that support the feature will recognize this bit.

Table 10-21. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip	0	Field Value +1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip	0	Field Value +1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

10.3.9.6.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in [Table 10-22](#) and [Table 10-23](#);
- For a BGRA data type, the B component would be in the LSB location;

Table 10-22. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 10-23. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in [Table 10-24](#) and [Table 10-25](#). The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 10-24. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 10-25. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

[Table 10-26](#) shows the proper settings required for RGB data types for both storage schemes.

Table 10-26. VPDMA Descriptor RGB Data Type Mapping

Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	Column A Data stored in the VPDMA defined order	Column B Data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In [Table 10-26](#), if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

Table 10-27 shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 10-27. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UYV	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYYV (YUV422I_UYYV)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see ⁽¹⁾)
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see ⁽¹⁾)

⁽¹⁾ If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to [Section 10.3.9.8, VPDMA Data Formats](#).

10.3.9.6.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

10.3.9.6.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

10.3.9.6.1.1.4 1D

This bit is set if a large one dimensional frame needs to be send to the client. In this case the stride is ignored and for the write the stride the generated descriptor will always be 0. If this bit is set then the transfer length and transfer height and frame width and frame height fields are combined to form one 32 bit field with the upper 8 bits reserved and the lower 24 bits being the size of the frame in pixels.

10.3.9.6.1.1.5 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

10.3.9.6.1.1.6 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

10.3.9.6.1.1.7 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

10.3.9.6.1.2 Data Packet Descriptor Word 1

Table 10-28. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

10.3.9.6.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

10.3.9.6.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

10.3.9.6.1.3 Data Packet Descriptor Word 2

Table 10-29. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0] If Mode is TILED, then TILER specific ADDRESS Map is used: Bits 31-29: 0 0-degree view 1h 180-degree view + mirroring 2h 0-degree view + mirroring 3h 180-degree view 4h 270-degree view + mirroring 5h 270-degree view 6h 90-degree view 7h 90-degree view + mirroring Bits 28-27: 0 8-bit container 1h 16-bit container 2h 32-bit container 3h Page Mode If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

10.3.9.6.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

10.3.9.6.1.4 Data Packet Descriptor Word 3

Table 10-30. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 10.3.9.6.1.4.5, Priority , for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

10.3.9.6.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

10.3.9.6.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

10.3.9.6.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

10.3.9.6.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

10.3.9.6.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

10.3.9.6.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

10.3.9.6.1.5 Data Packet Descriptor Word 4

10.3.9.6.1.5.1 Inbound data

Table 10-31. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

10.3.9.6.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

10.3.9.6.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

10.3.9.6.1.5.2 Outbound data

Table 10-32. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

10.3.9.6.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

10.3.9.6.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

10.3.9.6.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit, no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written. If it is desired that all the descriptors are written in order to a set queue then this bit should be set and the CURRENT_DESCRIPTOR, DESCRIPTOR_TOP and DESCRIPTOR_BOTTOM registers are used to define the location of the descriptor queue that will be written.

10.3.9.6.1.5.2.4 Use Descriptor Register

Bit 0 determines where the descriptor should be written. If it is desired that all the descriptors are written in order to a set queue then this bit should be set and the CURRENT_DESCRIPTOR, DESCRIPTOR_TOP and DESCRIPTOR_BOTTOM registers are used to define the location of the descriptor queue that will be written.

10.3.9.6.1.6 Data Packet Descriptor Word 5

10.3.9.6.1.6.1 Outbound data

Table 10-33. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	The maximum allowable pixels per line. 0: Unlimited Line Size 1: Use VPE_MAX_SIZE1 Max Width field 2: Use VPE_MAX_SIZE2 Max Width field 3: Use VPE_MAX_SIZE3 Max Width field 4: 352 pixels 5: 768 pixels 6: 1280 pixels 7: 1920 pixels Others: Reserved
2:0	Max Height	The maximum allowable lines per frame. 0: Unlimited Frame Size 1: Use VPE_MAX_SIZE1 Max Height field 2: Use VPE_MAX_SIZE2 Max Height field 3: Use VPE_MAX_SIZE3 Max Height field 4: 288 lines 5: 576 lines 6: 720 lines 7: 1080 lines Others: Reserved

NOTE: Width and Height are set in the following register bit-fields:

- For [VPE_MAX_SIZE1](#): [VPE_MAX_SIZE1](#)[31:16] MAX_WIDTH and [VPE_MAX_SIZE1](#)[15:0] MAX_HEIGHT
- For [VPE_MAX_SIZE2](#): [VPE_MAX_SIZE2](#)[31:16] MAX_WIDTH and [VPE_MAX_SIZE2](#)[15:0] MAX_HEIGHT registers
- For [VPE_MAX_SIZE3](#): [VPE_MAX_SIZE3](#)[31:16] MAX_WIDTH and [VPE_MAX_SIZE3](#)[15:0] MAX_HEIGHT

10.3.9.6.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger then 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

10.3.9.6.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

10.3.9.6.1.7 Data Packet Descriptor Word 6/7 (Data)

The words 4/5 give a 64 bit of configuration that can be passed specifically to the module that supports it. This is passed directly down to the module through a VPI Control port. Please see the section on the specific clients for the format of this data.

10.3.9.6.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

10.3.9.6.2.1 Configuration Descriptor Header Word0

Table 10-34. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

10.3.9.6.2.2 Configuration Descriptor Header Word1

Table 10-35. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

10.3.9.6.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

10.3.9.6.2.3 Configuration Descriptor Header Word2

Table 10-36. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

10.3.9.6.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

10.3.9.6.2.4 Configuration Descriptor Header Word3

Table 10-37. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

10.3.9.6.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

10.3.9.6.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

10.3.9.6.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger than the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

10.3.9.6.2.4.3.1 Address Data Block Format

Table 10-38. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

10.3.9.6.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 10-39. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
4	VPE Scaler	VPE Scaler Coefficient Tables

10.3.9.6.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

10.3.9.6.3 Control Descriptor

10.3.9.6.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

10.3.9.6.3.2 Control Descriptor Header Description

Table 10-40. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

10.3.9.6.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

10.3.9.6.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

10.3.9.6.3.2.3 Control

The Control field defines the specific function of the descriptor. [Table 10-41](#) lists the different control descriptors.

10.3.9.6.3.3 Control Descriptor Types

Table 10-41. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the VPE_LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

10.3.9.6.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 10-42. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 10-43. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 10-43. Sync on Client Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

10.3.9.6.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 10-44. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

10.3.9.6.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the [VPE_LIST_STAT_SYNC](#) register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the [VPE_LIST_STAT_SYNC](#) bit for the list number that called the descriptor.

Table 10-45. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

10.3.9.6.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 10-46. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 10-46. Sync on Channel Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

10.3.9.6.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

10.3.9.6.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 10-47. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 10-48. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 10-49. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

10.3.9.6.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information of VPDMA interrupt events, see [Section 10.3.9.5, VPDMA Interrupts](#).

Table 10-50. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

10.3.9.6.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 10-51. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 10-52. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 10-53. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

10.3.9.6.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 10-54. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

10.3.9.7 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

10.3.9.7.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the [VPE_LIST_ADDR\[31:0\]](#) [VPE_LIST_ADDR](#) register and then writes the LIST_ATTR register. If the NUMBER in the [VPE_LIST_ATTR\[26:24\]](#) LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the [VPE_LIST_ATTR\[26:24\]](#) LIST_NUM is busy then the [VPE_LIST_ADDR\[31:0\]](#) LIST_ADDR and [VPE_LIST_ATTR](#) registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

10.3.9.7.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

10.3.9.7.2.1 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIP1_PORTA_LUMA and VIP1_PORTA_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

10.3.9.7.2.2 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIP1_PORTA_LUMA or VIP1_PORTA_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

10.3.9.7.2.3 Single RGB Stream

If the port is configured to be used to send out RGB stream then the channel VIP1_PORTA_RGB must be used. The incoming data is then assumed to be RGB 888 data and this is combined with the Background Color Alpha register field to make ARGB8888 data that will then be sent out based on the data type. If the data type uses less than the full 8 bits the lower bits are dropped and just the upper bits are sent to get the correct data format.

10.3.9.8 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

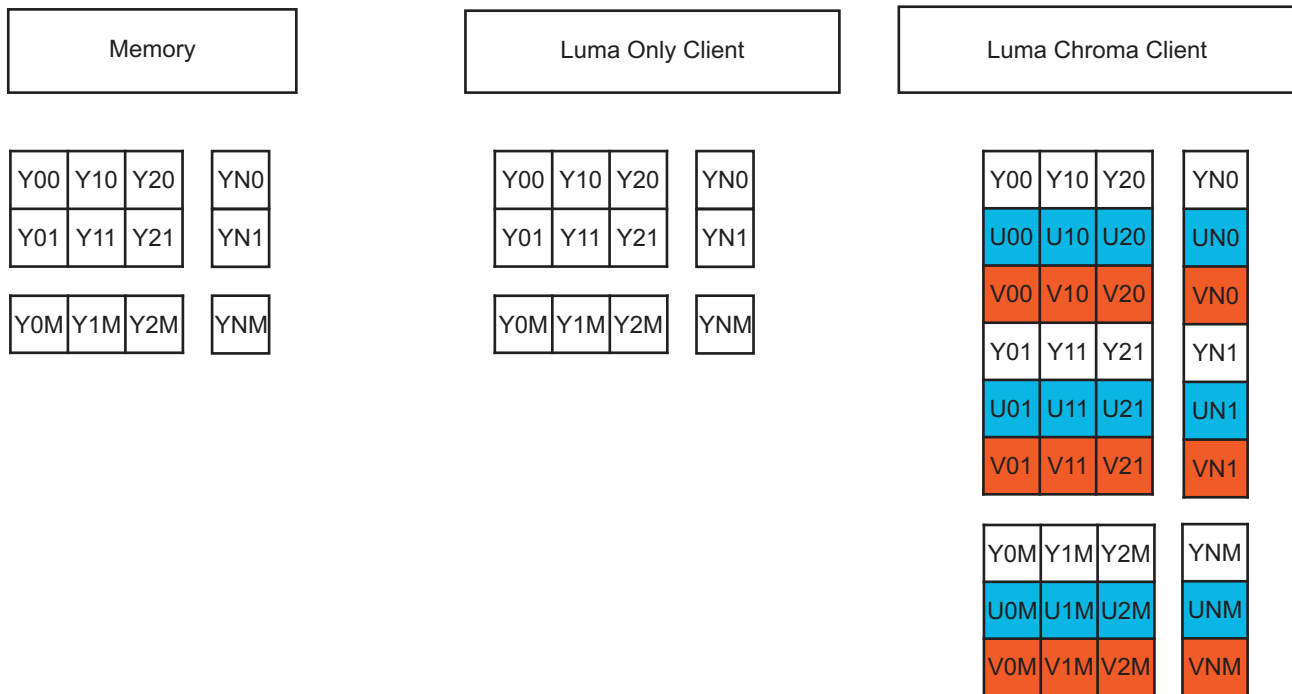

10.3.9.8.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left hand corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

10.3.9.8.1.1 Y 4:4:4 (Data Type 0)

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

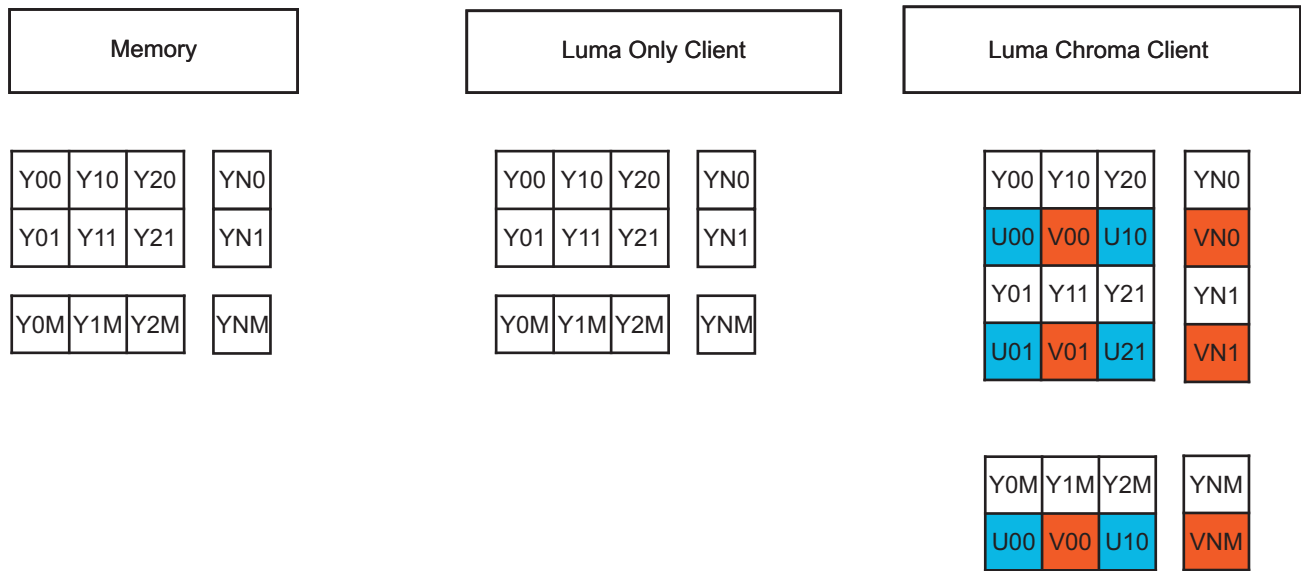

Figure 10-51. Y 4:4:4 (Data Type 0)

10.3.9.8.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

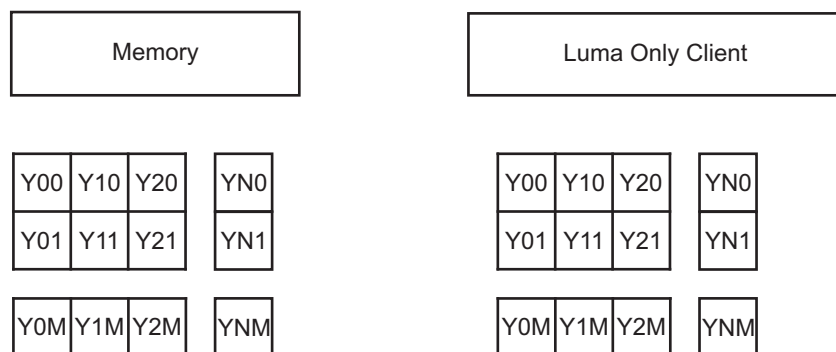

Figure 10-52. Y 4:2:2 (Data Type 1)

10.3.9.8.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 10-53. Y 4:2:0 (Data Type 2)

10.3.9.8.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

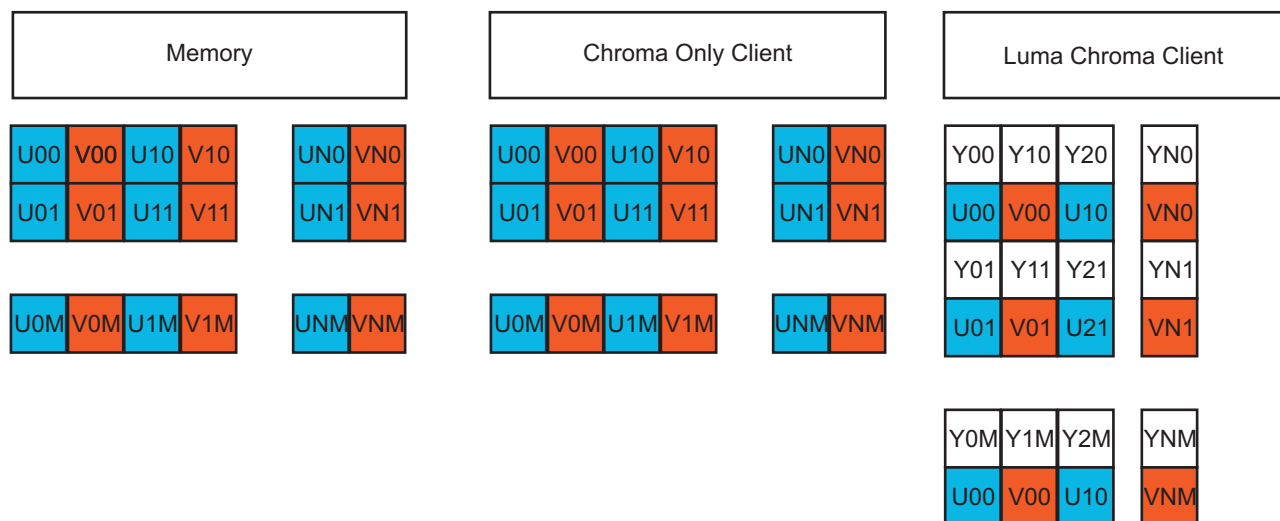

Figure 10-54. C 4:4:4 (Data Type 4)

10.3.9.8.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

Figure 10-55. C 4:2:2 (Data Type 5)

10.3.9.8.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

Figure 10-56. C 4:2:0 (Data Type 6)

10.3.9.8.1.7 YC 4:2:2 (Data Type 7)

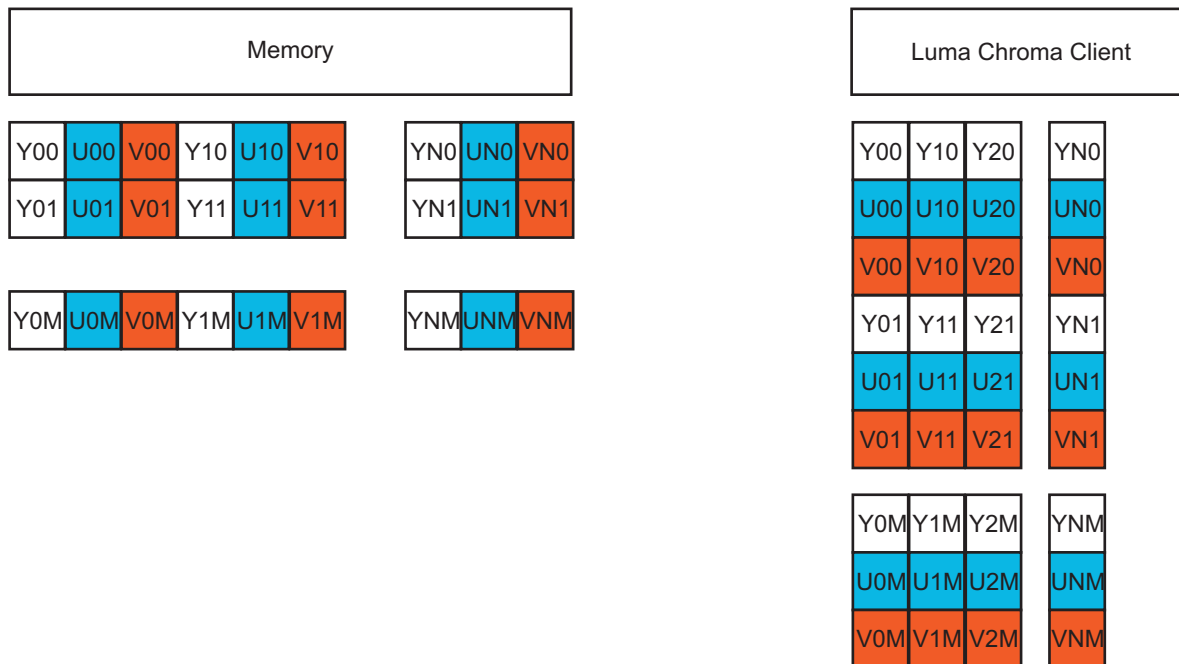

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 10-57. YC 4:2:2 (Data Type 7)

10.3.9.8.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

Figure 10-58. YC 4:4:4 (Data Type 8)

10.3.9.8.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 10-59. CY 4:2:2 (Data Type 23h)

10.3.9.8.2 RGB Data Formats

The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less than the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

10.3.9.8.2.1 Input Data Formats

10.3.9.8.2.1.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 10-60. RGB16-565 (Data Type 0)

10.3.9.8.2.1.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 10-61. ARGB-1555 (Data Type 1)

10.3.9.8.2.1.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

Figure 10-62. ARGB-4444 (Data Type 2)

10.3.9.8.2.1.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 10-63. RGBA-5551 (Data Type 3)

10.3.9.8.2.1.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

Figure 10-64. RGBA-4444 (Data Type 4)

10.3.9.8.2.1.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 10-65. ARGB24-6666 (Data Type 5)

10.3.9.8.2.1.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the `VPE_BG_RGB` Blend value for the Blend value.

Figure 10-66. RGB24-888 (Data Type 6)

10.3.9.8.2.1.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

Figure 10-67. ARGB32-8888 (Data Type 7)

10.3.9.8.2.1.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 10-68. RGBA24-6666 (Data Type 8)

10.3.9.8.2.1.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 10-69. RGBA32-8888 (Data Type 9)

10.3.9.8.2.2 Output Data Formats

10.3.9.8.2.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 10-70. RGB16-565 (Data Type 0)

10.3.9.8.2.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 10-71. ARGB-1555 (Data Type 1)

10.3.9.8.2.2.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

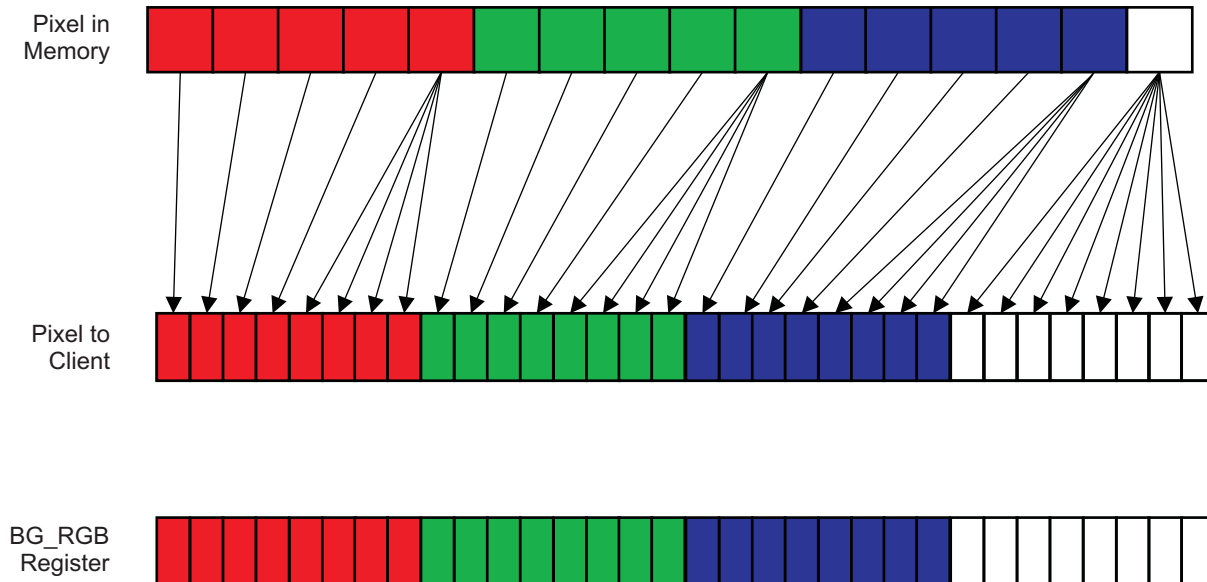

Figure 10-72. ARGB-4444 (Data Type 2)

10.3.9.8.2.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 10-73. RGBA-5551 (Data Type 3)

10.3.9.8.2.2.5 **RGBA-4444 (Data Type 4)**

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

Figure 10-74. RGBA-4444 (Data Type 4)

10.3.9.8.2.2.6 **ARGB24-6666 (Data Type 5)**

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 10-75. ARGB24-6666 (Data Type 5)

10.3.9.8.2.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the `VPE_BG_RGB` Blend value for the Blend value.

Figure 10-76. RGB24-888 (Data Type 6)

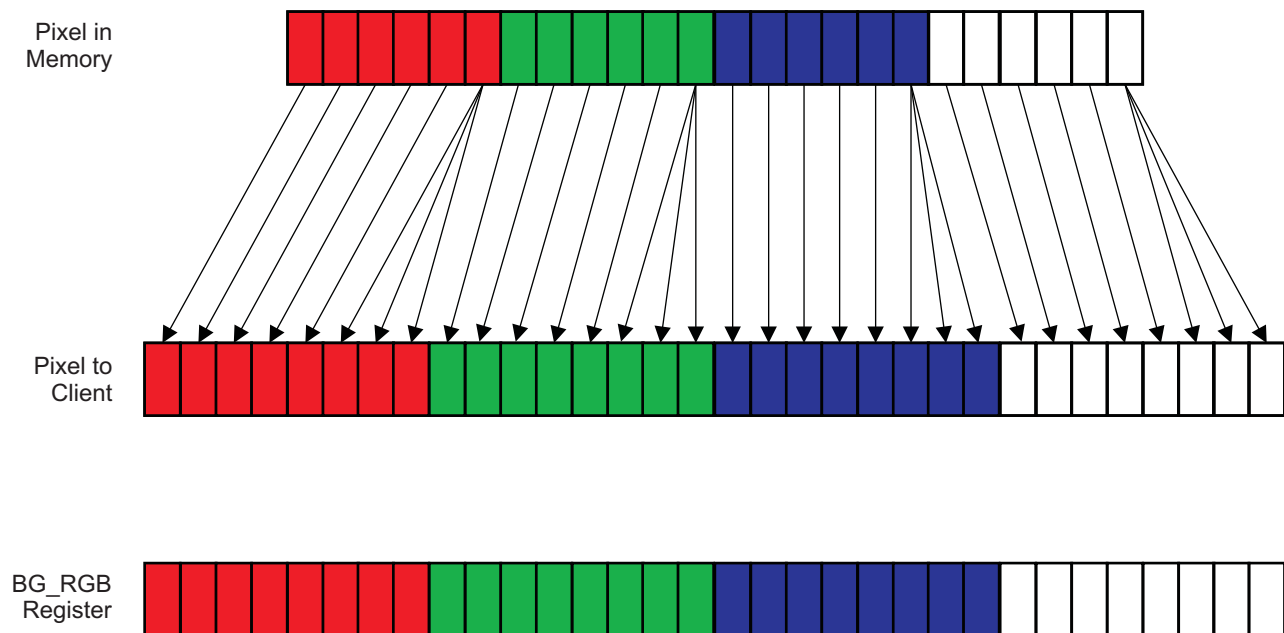

10.3.9.8.2.2.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

Figure 10-77. ARGB32-8888 (Data Type 7)

10.3.9.8.2.2.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 10-78. RGBA24-6666 (Data Type 8)

10.3.9.8.2.2.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 10-79. RGBA32-8888 (Data Type 9)

10.3.9.8.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

10.3.10 VPE Software Reset

Software reset in the VPE module can be done by setting the `VPE_CLKC_RST[1]` PRIM_DP_RST and `VPE_CLKC_RST[0]` VPDMA_RST for VPE VPDMA to 0x1. Software must ensure that the software reset completes before performing operations within the VPE module.

10.3.11 VPE Power and Clocks Management

The VPE modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

Power Management within the VPE module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - L3_CLK and L4_CLK.

10.3.11.1 VPE Clocks

The VPE internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - [VPE_CLKC_CLKEN](#)[1] PRIM_DP_EN and [VPE_CLKC_CLKEN](#)[0] VPDMA_EN for the VPDMA engine

10.3.11.2 VPE Idle Mode

The VPE supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [VPE_SYSCONFIG](#)[3:2] IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

10.3.11.3 VPE StandBy Mode

The VPE supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the [VPE_SYSCONFIG](#)[5:4] STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

10.4.2.2 VPE_CSC Register Description

Table 10-57. VPE_CSC00

Address Offset	0x0000 0000	Instance	VPE_CSC
Physical Address	0x489D 5700		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		R	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of -4. to +4 represent in Q3.10 format. The MSB is sign bit. (Same format conversion as A0 in VPE_CSC00)	RW	0x0
15:13	RESERVED		R	0x0
12:0	A0	Its is represented as Q3.10 number. So the value ranges from -4 to +4. To convert a decimal number, multiply the number by 1024 and write it in the register in hex format. For example, to program 0.673, 0x2B1 should be written in the register. (int)(0.673 X 1024) = (int)689.152 = 689 = 0x2B1. If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is - 1.893, 0x186E needs to be written in the register. (int)(-1.893*1024)= -1938 = 0x186E (2'S compliment format of -1938 in 13-bit width)	RW	0x0

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH from the offset specified by offW and offH. 0x0 : Disable trimming 0x1 : Enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:12	RESERVED		R	0x0
11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by horizontal and vertical scaling. 0x0 : The input video format is progressive 0x1 : The input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON'T CARE. If cfg_auto_hs is 1, then: 0x0: The polyphase scaler is always used regardless of the scaling ratio. 0x1: The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio < 0.25). (3) This register is DON'T CARE when cfg_auto_hs = 1	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 < horizontal scale ratio < 0.5). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0x0 : the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 0x1 : HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR > 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 > SR > 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 > SR > 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR <= 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	RESERVED		R	0x0
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0x0 : Poly-phase filter will be used for the vertical scaling 0x1 : Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INV_T_FID	This parameter is used by vertical scaling. 0x0 : Progressive input 0x1 : Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is general purpose. 0x0 : Scaling module will be engaged 0x1 : Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0x0 : Anamorphic scaling 0x1 : Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0x0 : The output format of SC is progressive (default); 0x1 : The output format of SC is interlace	RW	0x0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MDT_MVSTMAX_COR_THR				MDT_MV_COR_THR				MDT_SF_SC_THR3								MDT_SF_SC_THR2								MDT_SF_SC_THR1							

Bits	Field Name	Description	Type	Reset
31:28	MDT_MVSTMAX_COR_THR	This is used for increasing noise robustness. Increasing this threshold leads to more robustness to noise, but with the potential of introducing ghosting effect. Note that this threshold is used for motion values for EDI only, and it is in addition mdt_mv_cor_thr.	RW	0x0
27:24	MDT_MV_COR_THR	This threshold is for the coring for motion value, mv. MDT will become more noise robust if this value increases. But the picture may be washed out if this value is set to high. This threshold can be interpreted as the noise threshold for calculating motion values for all blocks.	RW	0x0
23:16	MDT_SF_SC_THR3	Spatial frequency threshold 3	RW	0x0
15:8	MDT_SF_SC_THR2	Spatial frequency threshold 2	RW	0x0
7:0	MDT_SF_SC_THR1	Spatial frequency threshold It is used for adaptive scaling of motion values according to how busy the texture is. If the texture is flat, motion values need to be scaled up to reflect the sensitivity of motion values with respect to the detection error. Increasing the thresholds will make the motion value scaling more sensitive to the frequency of the texture. Note: 0 = mdt_sf_sc_thr1 = mdt_sf_sc_thr2 = mdt_sf_sc_thr3	RW	0x0

Bits	Field Name	Description	Type	Reset
31:24	EDI_COR_SCALE_FACTOR	Scaling factor for correlation along detected edge	RW	0x0
23:16	EDI_DIR_COR_LOWER_THR	Lower threshold used for correlation along detected edge	RW	0x0
15:8	EDI_CHROMA3D_COR_THR	Correlation threshold used in 3D processing for chroma. Because the motion values used for chroma 3D processing are based on luma only. Extra protection is needed. Temporal interpolation is only performed for chroma, when there is strong spatial or temporal correlation for the chroma pixel being processed. When the pixel difference is less than this threshold, it is assumed that there exists strong correlation between these two pixels. Thus, increasing this value leads to more chroma pixels being processed in 3D	RW	0x0
7:4	RESERVED		R	0x0
3	EDI_CHROMA_3D_ENABLE	3D Chroma Enable 0x0 : Disable 3D processing for chroma 0x1 : Enable 3D processing (temporal interpolation)	RW	0x0
2	EDI_ENABLE_3D	3D Enable 0x0 : Disable 3D processing 0x1 : Enable 3D processing (temporal interpolation)	RW	0x0
1:0	EDI_INP_MODE	Interpolation mode. Note that mode 00 and 01 are used for debug purpose 0x0 : line average 0x1 : field average 0x2 : edge-directed interpolation for luma only 0x3 : edge-directed interpolation for both luma and chroma	RW	0x0

FMD_CAF_LINE_THR								FMD_CAF_FIELD_THR								RESERVED								FMD_BED_ENABLE	FMD_JAM_DIR	FMD_LOCK	FMD_ENABLE				

Bits	Field Name	Description	Type	Reset
31:24	FMD_CAF_LINE_THR	CAF threshold used for the pixels from two lines in one field This is the threshold used for combing artifacts detection. The difference of two consecutive lines from the same field (so there is one line in between if two fields are merged into one progressive frame) is compared with this threshold. Decreasing this threshold leads to be more conservative in detecting CAF. Both fmd_caf_field_thr and fmd_caf_line_thr are close the values that two pixels differed by this value is observable.	RW	0x0
23:16	FMD_CAF_FIELD_THR	CAF threshold used for the pixels from two fields This is the threshold used for combing artifacts detection. The difference of two consecutive lines (when merging two fields into one progressive frame) is used to compare with this threshold. Increasing this threshold leads to be more conservative in detecting CAF.	RW	0x0

10.4.6 VPE_VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VPE VPDMA in this family of devices:

- All VPE_INT1_* registers
- All VPE_INT2_* registers
- All VPE_INT3_* registers

The following channels are not used by VPE VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- VIP1_*, except for the following:
 - VIP1_PORTA_RGB
 - VIP1_PORTA_LUMA
 - VIP1_PORTA_CHROMA
 - VIP2_*
 - GRPX_*
 - SCALER_OUT
 - SCALER_LUMA
 - SCALER_CHROMA
 - NF_*
 - TRANSCODE1_*
 - TRANSCODE2_*
 - AUX_IN
 - PIP_FRAME
 - POST_COMP_WR
 - VBI_SD_VENC
-

NOTE: The following clients are not used by VPE VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- VIP1_*, except for the following:
 - VIP1_UP_UV
 - VIP1_UP_Y
- VIP2_*
- TRANS1_LUMA
- TRANS1_CHROMA
- TRANS2_LUMA
- TRANS2_CHROMA
- HDMI_WRBK
- VBI_SDVENC
- NF_420_UV_OUT
- NF_420_Y_OUT
- NF_420_UV_IN
- NF_420_Y_IN
- NF_422_IN
- GRPX1_ST
- GRPX2_ST
- GRPX3_ST
- GRPX1_DATA
- GRPX2_DATA
- GRPX3_DATA
- PIP_WRBK
- SC_IN_*
- SC_OUT
- COMP_WRBK

10.4.6.2 VPE_VPDMA Register Description

Table 10-161. VPE_VPDMA_PID

Address Offset	0x0000 0000	Instance	VPE_VPDMA
Physical Address	0x489D D000		
Description	This register follows the format described in PDR3.5		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SCHEME		FUNC															RTL					MAJOR			VPDMA_LOAD_COMPLETE	VPDMA_ACCESS_TYPE	MINOR				

Bits	Field Name	Description	Type	Reset
31:30	SCHEME	The scheme of the register used. Currently this is PDR 3.5 Scheme	R	0x0
29:16	FUNC	The function of the module being used. The value is for vpe0_vayu_vpdma.	R	0x0
15:11	RTL	RTL Release Version The PDR release number of this IP. After Bootup this value becomes the firmware Revision ID	R	0x0
10:8	MAJOR	Major Release Number	R	0x0
7	VPDMA_LOAD_COMPLETE	This bit will be 1 when the VPDMA state machines image and data image have successfully been fetched and loaded.	R	0x0
6	VPDMA_ACCESS_TYPE	After bootup this bit states how DMA transaction are setup by lists or through register access. 0x0 : Lists 0x1 : Register Access	R	0x0
5:0	MINOR	Minor Release Number	R	0x0

Table 10-163. VPE_LIST_ADDR

Address Offset	0x0000 0004	Instance	VPE_VPDMA
Physical Address	0x489D D004		
Description	The location of a new list to begin processing.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LIST_ADDR																															

Bits	Field Name	Description	Type	Reset
31:0	LIST_ADDR	Location of a new list of descriptors. This register must be written with the VPDMA Configuration Location after reset.	RW	0x0

Table 10-164. Register Call Summary for Register VPE_LIST_ADDR

Table 10-165. VPE_LIST_ATTR

Address Offset	0x0000 0008	Instance	VPE_VPDMA
Physical Address	0x489D D008		
Description	The attributes of a new list. This register should always be written after list_addr.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				LIST_NUM			RESERVED	STOP	RDY	LIST_TYPE			LIST_SIZE																		

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at LIST_ADDR. If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VPE_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated. 0x0 : Normal List 0x1 : Self-Modifying List 0x2 : List Doorbell Others Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Table 10-167. VPE_LIST_STAT_SYNC

Address Offset	0x0000 000C	Instance	VPE_VPDMA
Physical Address	0x489D D00C		
Description	The register is used for processor to List Manager synchronization and status registers for the list.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								LIST7_BUSY	LIST6_BUSY	LIST5_BUSY	LIST4_BUSY	LIST3_BUSY	LIST2_BUSY	LIST1_BUSY	LIST0_BUSY	RESERVED								SYNC_LISTS7	SYNC_LISTS6	SYNC_LISTS5	SYNC_LISTS4	SYNC_LISTS3	SYNC_LISTS2	SYNC_LISTS1	SYNC_LISTS0

Bits	Field Name	Description	Type	Reset
31:24	RESERVED		R	0x0
23	LIST7_BUSY	The list 7 is currently running. Any attempt to load a new list to list 7 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
22	LIST6_BUSY	The list 6 is currently running. Any attempt to load a new list to list 6 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
21	LIST5_BUSY	The list 5 is currently running. Any attempt to load a new list to list 5 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
20	LIST4_BUSY	The list 4 is currently running. Any attempt to load a new list to list 4 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
19	LIST3_BUSY	The list 3 is currently running. Any attempt to load a new list to list 3 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
18	LIST2_BUSY	The list 2 is currently running. Any attempt to load a new list to list 2 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
17	LIST1_BUSY	The list 1 is currently running. Any attempt to load a new list to list 1 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
16	LIST0_BUSY	The list 0 is currently running. Any attempt to load a new list to list 0 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
15:8	RESERVED		R	0x0
7	SYNC_LISTS7	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 7 waiting on it.	RW	0x0
6	SYNC_LISTS6	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 6 waiting on it.	RW	0x0
5	SYNC_LISTS5	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 5 waiting on it.	RW	0x0
4	SYNC_LISTS4	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 4 waiting on it.	RW	0x0
3	SYNC_LISTS3	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 3 waiting on it.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	SYNC_LISTS2	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 2 waiting on it.	RW	0x0
1	SYNC_LISTS1	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 1 waiting on it.	RW	0x0
0	SYNC_LISTS0	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 0 waiting on it.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sd_venc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

31	INT_STAT_CONTROL_DESCRIPTOR_INT15	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_CONTROL_DESCRIPTOR_INT14	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_CONTROL_DESCRIPTOR_INT13	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START	LINE_MODE	RESERVED											

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client. 0 : Change in value of hdmi_field_id 1 : Change in value of dvo2_field_id 2 : Change in value of hdcomp_field_id 3 : Change in value of sd_field_id 4 : Use List Manager Internal Field0 5 : Use List Manager Internal Field1 6 : Use List Manager Internal Field2 7 : Start on channel active	RW	0x0
9:8	LINE_MODE	Selects the output mode of the line buffer. 0: repeat lines twice each output data line gets 2 times the number of frame lines. 1: each line once with Line Buffer Disabled, so no mirroring. Each line gets frame lines with identical data. 2: Each line seen once Mirroring is enabled so the top lines get the top lines repeated at the top of the frame and the bottom lines have the bottom lines repeated. Each line of data gets frame lines + number of buffered lines. 3: each line once only on one line. Each data line gets number of frame lines divided by number of buffered lines.	RW	0x0
7:0	RESERVED		R	0x0

RESERVED																							STANDBYMODE	IDLEMODE	RESERVED						

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x0
5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only 0x2: Same behavior as bit-field value of 0x1. 0x3: Reserved	RW	0x2
3:2	IDLEMODE	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state 0x0: Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only 0x1: No-idle mode: local target never enters idle state. Backup mode, for debug only 0x2: Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events 0x3: Smart-idle wakeup-capable mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module may generate (IRQ- or DMA-request-related) wakeup events when in idle state. Mode is only relevant if the appropriate IP module "swakeup" output(s) is (are) implemented	RW	0x2
1:0	RESERVED		R	0x0

Display Subsystem

This chapter describes the display subsystem for the device.

NOTE: This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

NOTE: All the Display and HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which Display and HDMI features are supported.

Topic	Page
11.1 Display Subsystem Overview	2610
11.2 Display Controller	2665
11.3 High-Definition Multimedia Interface	2947

11.1 Display Subsystem Overview

The Display Subsystem (DSS) provides the logic to display a video frame from the system memory frame buffer on a liquid-crystal display (LCD) panel or TV set.

The display subsystem can display different pictures simultaneously by using three LCD outputs (LCD1, LCD2, and LCD3), in addition to a TV output.

All three LCD outputs are available on three parallel interfaces (DPI1, DPI2, and DPI3), providing support for MIPI DPI 2.0, or BT-656 or BT-1120.

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

The TV output is available on one of the following interfaces

- High-Definition Multimedia Interface (HDMI)
- DPI1 parallel interface

The modules integrated in the display subsystem are:

- Display controller (DISPC):
 - One direct memory access (DMA) engine
 - One graphics pipeline (GFX), three video (VID) pipelines, and one write-back (WB) pipeline
 - Three LCD outputs and one TV output, each with a dedicated overlay manager
- HDMI protocol engine:
 - HDMI 1.4a support up to 1080p@60Hz (including 3D frame-packing support)
 - 36-bit RGB color
 - HDCP 1.4 key protection
 - Deep color mode support (10-bit/12-bit for 148.5-MHz pixel clock)

The necessary video phase-locked loops (PLLs) with their corresponding control modules, and the physical layer (PHY) for HDMI are outside the display subsystem. The video PLLs allow independent display outputs at different frequencies. The supported PLLs and PHY are:

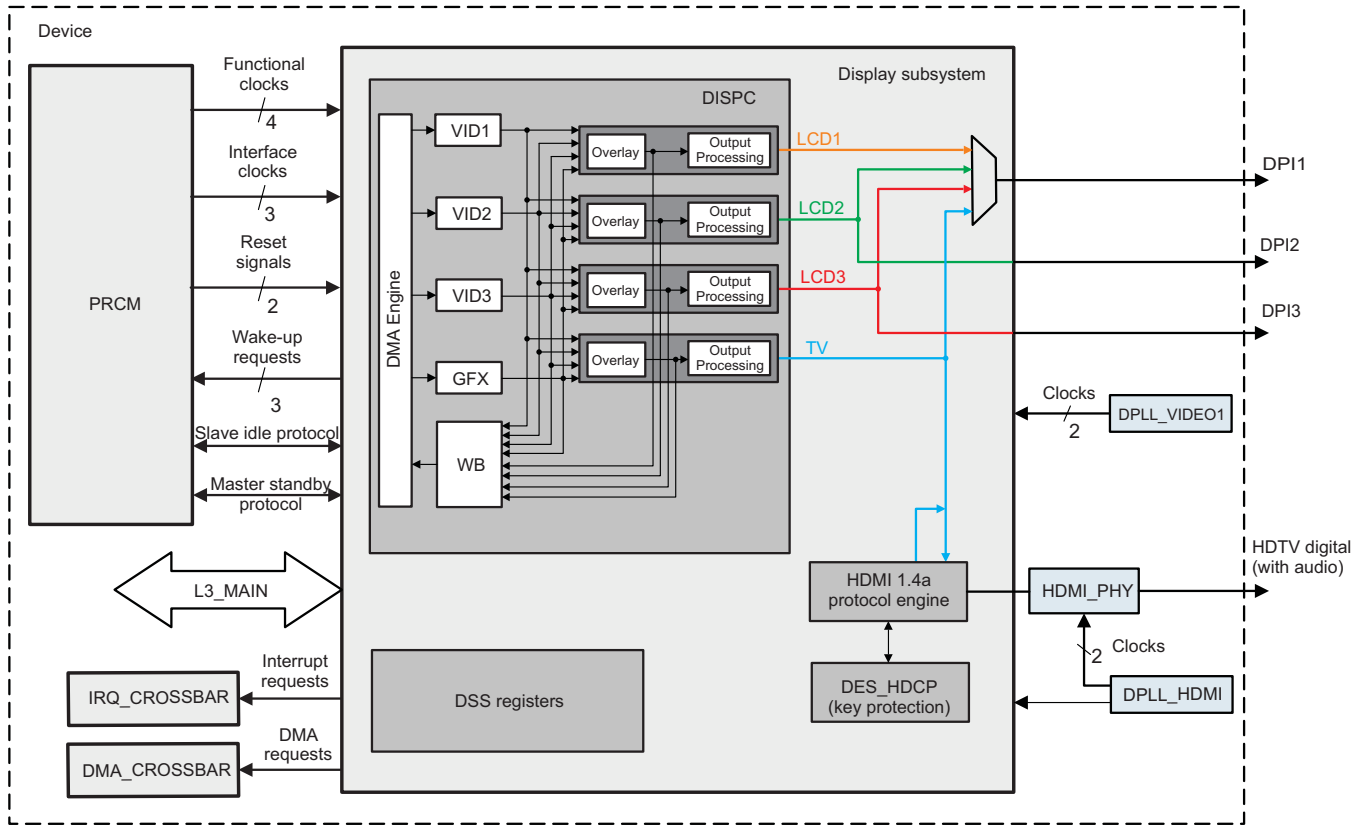

- DPLL_HDMI / HDMI_PHY
- DPLL_VIDEO1

To ensure efficient bandwidth, the display subsystem integrates a connection between the device L3_MAIN interconnect and the DISPC to exchange data with synchronous dynamic random access memory (SDRAM) using the DISPC DMA engine. The same connection is also used for configuration.

NOTE: All the Display and HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which Display and HDMI features are supported.

Figure 11-1 is a high-level diagram of the display subsystem.

Figure 11-1. Display Subsystem Overview

dss-001

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.1.1 Display Subsystem Environment

This section describes the various outputs handled by the display subsystem:

- LCD support
- TV display support

Figure 11-2 is a diagram of the display subsystem environment.

Figure 11-2. Display Subsystem Environment

dss-002

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see [Section 18.4.6.1.1 Pad Configuration Registers](#) in [Chapter 18, Control Module](#).

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.1.1.1 Display Subsystem LCD Support

LCD panels can be connected to the display subsystem of the device using DPI1, DPI2, and/or DPI3 parallel interfaces.

11.1.1.1 Display Subsystem LCD with Parallel Interfaces

Using parallel output mode, the module on the display subsystem processing path is DISPC.

In synchronous parallel interface, the required data and control signals are provided directly to external MIPI DPI 2.0, or BT-656 or BT-1120 compatible parallel panels.

The DISPC is connected to the system memory through the device L3_MAIN interconnect and uses its own DMA engine (with embedded FIFO) to read data from the system memory. For more details, see [Section 11.2.1, Display Controller](#).

All three DISPC LCD outputs are available for DSS DPI1 output, with selection done through the [DSS_CTRL\[17:16\] PARALLEL_SEL](#) bit field (multiplexer 13 in [Figure 11-2](#)). DSS DPI2 and DPI3 outputs are hardwired to DISPC LCD2 and LCD3 outputs.

[Table 11-1](#) to [Table 11-3](#) lists the outgoing display subsystem signals on the device boundary pads.

Table 11-1. Display Subsystem DPI1 Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DSS_CTRL[17:16] PARALLEL_SEL = 1, 2, or 3 DISPC LCDx Channel Out (pixel data, clock, syncs) (where x = 1, 2, or 3)
vout1_fid	DISPC_LCDx_FID
vout1_clk	DISPC_LCDx_PCLK
vout1_de	DISPC_LCDx_DE
vout1_vsync	DISPC_LCDx_VSYNC
vout1_hsync	DISPC_LCDx_HSYNC
vout1_d[23:0]	DISPC_LCDx_DATA[23:0]

NOTE: By default, [DSS_CTRL\[17:16\] PARALLEL_SEL](#) = 0x0, and DISPC TV data and HDMI clk/sync signals are output on DPI1 interface pins. Software must program the [PARALLEL_SEL](#) bit-field to value other than 0x0, in order DISPC LCD data and clk/sync signals to be output on DPI1 interface pins.

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

Table 11-2. Display Subsystem DPI2 Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DISPC LCD2 Channel Out (pixel data, clock, syncs)
vout2_fid	DISPC_LCD2_FID

vout3_hsync	DISPC_LCD3_HSYNC

Table 11-3. Display Subsystem DPI3 Interface Signals Mapping (continued)

Signal Names at Device Pads (See Figure 11-2)	DISPC LCD3 Channel Out (pixel data, clock, syncs)
vout3_d[23:0]	DISPC_LCD3_DATA[23:0]

For more details on LCD output pixel data formats for the parallel interface, see [Section 11.2 DISPC Environment](#), in *Display Controller*.

11.1.1.2 Display Subsystem TV Display Support

When TV data flow is needed from the display subsystem, the DPI1 output or HDMI output can be used.

11.1.1.2.1 Display Subsystem TV With Parallel Interfaces

In synchronous parallel interface configuration, the required data is provided by the DISPC TV output, and control signals are provided by the HDMI module. Then they are merged and provided to the DPI1 output.

This configuration option is available and can be selected through the [DSS_CTRL\[17:16\] PARALLEL_SEL](#) bit field (multiplexer 13 in [Figure 11-4](#)).

[Table 11-4](#) lists the outgoing display subsystem signals on the device boundary pads.

Table 11-4. Display Subsystem TV Parallel Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DSS_CTRL[17:16] PARALLEL_SEL = 0 DISPC TV Channel Out (pixel data) HDMI (pixel clock, syncs)
vout1_fid	HDMI_M_FID

vout1_vsync	HDMI_M_VS
vout1_hsync	HDMI_M_HS
vout1_d[23:0]	DISPC_TV_DATA[29:0]

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

For more details on TV output pixel data formats for the parallel interface, see [Section 11.2.2 DISPC Environment](#), in [Section 11.2.1 Display Controller](#).

11.1.1.2.2 Display Subsystem TV With Serial Interfaces

In serial interface configuration, the HDMI module is used. The DISPC, HDMI, DES_HDCP, and the associated HDMI PHY module are used in the data path. The HDMI module converts the RGB video into standard high-definition digital video format. The HDMI module has a dedicated PLL, which can multiply the pixel clock by an appropriate factor. The data is transmitted on three differential data pairs and an additional clock pair.

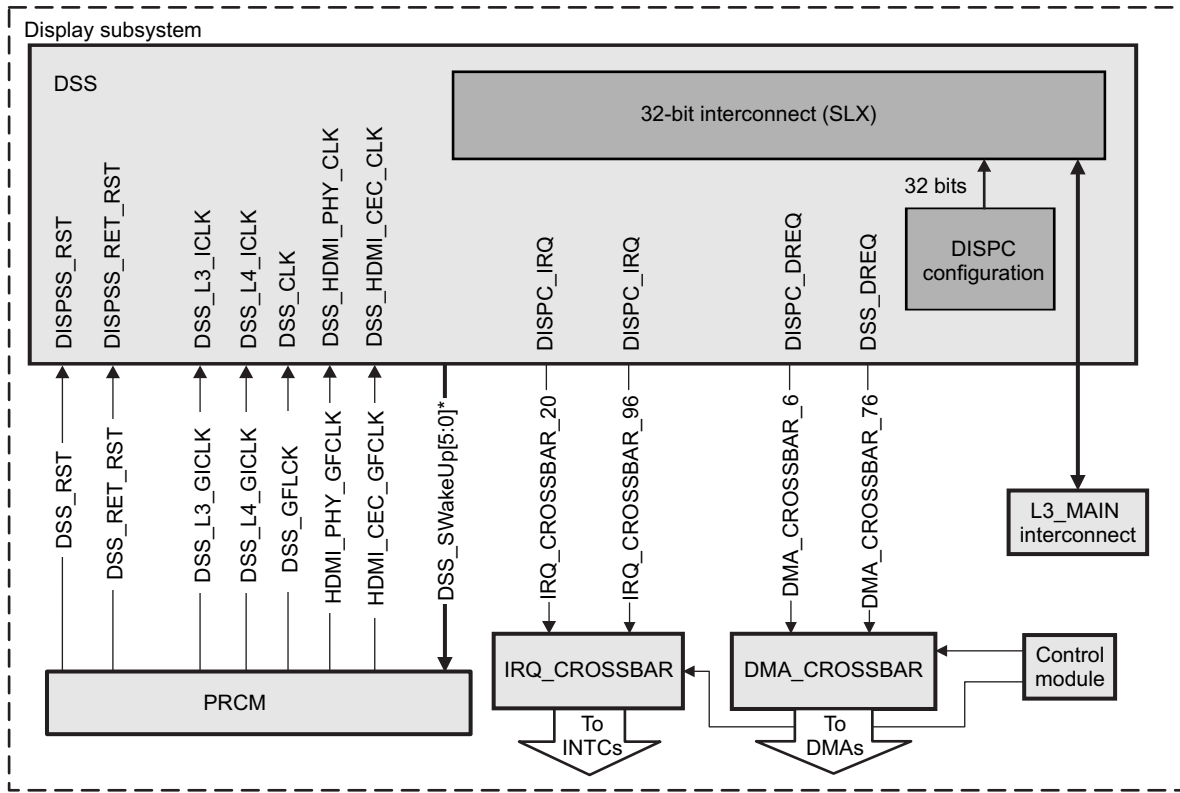

For more details, see [Section 11.3](#), in *High-Definition Multimedia Interface*.

11.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

[Figure 11-3](#) shows the integration of the display subsystem in the device.

Figure 11-3. Display Subsystem Integration

* Generic names, refer to appropriate subsection for details dss-003

Table 11-5. Display Subsystem Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 PRUSS1_IRQ_51 PRUSS2_IRQ_51 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.
HDMI	HDMI_IRQ	IRQ_CROSSBAR_96	MPU_IRQ_101 IPU1_IRQ_26 IPU2_IRQ_26	HDMI interrupt requests.
DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5 DMA_SYSTEM_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the DMA is generated by the DISPC IP.
HDMI	DSS_DREQ	DMA_CROSSBAR_76	DMA_SYSTEM_DREQ_75	Display subsystem HDMI audio DMA request

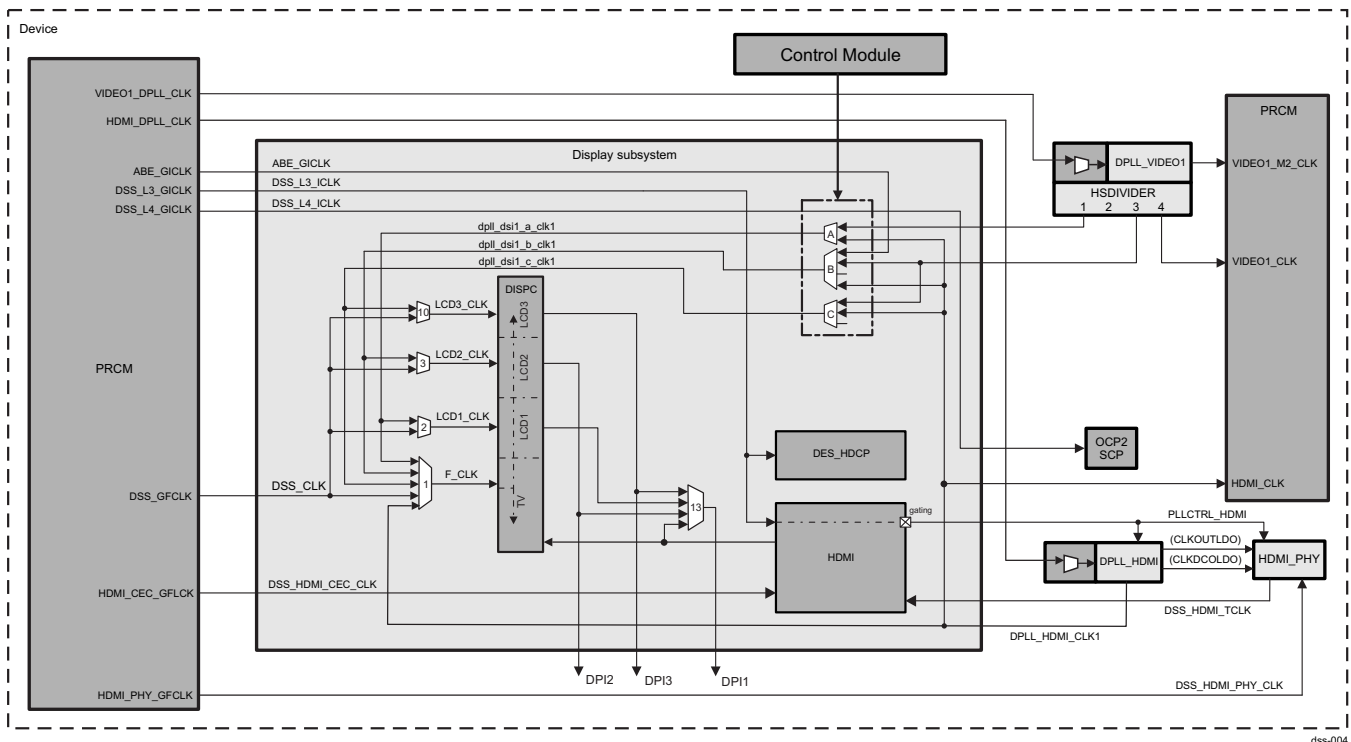

NOTE: The “Default Mapping” column in [Table 11-5 Display Subsystem Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively. For more information about the IRQ_CROSSBAR module, see [Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the DMA_CROSSBAR module, see [Section 18.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#). For more information about the device DMA_SYSTEM module, see [Section 16.1, System DMA](#). For more information about the device EDMA module, see [Section 16.2, Enhanced DMA](#).

11.1.2.1 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides clock signals to the display subsystem.

[Figure 11-4](#) shows the details of the display subsystem clock tree.

Figure 11-4. Display Subsystem Clock Tree

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

[Table 11-6](#) lists the main DSS clocks and their sources.

Table 11-6. Display Subsystem Clocks

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DPLL_VIDEO1 input	VIDEO1_DPLL_CLK	PRCM module	Functional clock
	DPLL_HDMI input	HDMI_DPLL_CLK	PRCM module	Functional clock
	DSS_L3_ICLK	DSS_L3_GICLK	PRCM module	Interface clock
	DSS_L4_ICLK	DSS_L3_GICLK	PRCM module	Interface clock
	-	ABE_GICLK	PRCM, DPLL_ABE	Functional clock

DPI3 functional/pixel clock	DSS_DISPC_LCD3_PCLK	DISPC	N/A	N/A
HDMI timing clock (DSS_HDMI_TCLK)	N/A	HDMI_PHY	N/A	N/A

NOTE:

- In [Figure 11-4](#), clkout1, clkout3, and clkout4 of DPLL_VIDEO1 correspond to M4, M6, and M7 outputs of the associated HS divider module (HSDIVIDER). For more information on the configuration of DPLL_VIDEO clocks, see [Section 11.1.3.3, DPLL_VIDEO Functional Description](#).
- For synchronization purpose, the clkout4 (M7) output of each HSDIVIDER is used to source McASP module and peripheral timers. For more information, see [Chapter 22, Timers](#), and [Section 24.6, Multichannel Audio Serial Ports](#).
- Multiplexers A, B, and C in [Figure 11-4](#) are controlled by [4:3] DSI1_A_CLK1_SELECTION, [6:5] DSI1_B_CLK1_SELECTION, and [8:7] DSI1_C_CLK1_SELECTION bit-fields, respectively, of DSS_PLL_CONTROL register in the device Control Module. For more information, see [Chapter 18, Control Module](#).

11.1.2.2 Display Subsystem Resets

The PRCM module provides two reset signals to the display subsystem.

[Figure 11-5](#) shows the details of the reset tree for the display subsystem.

Figure 11-5. Display Subsystem Reset Scheme

[Table 11-8](#) lists the resets for the display subsystem.

Table 11-8. Display Subsystem Resets

Module Instance	Destination Signal Name	Resets		
		Source Signal Name	Source	Description
DSS	DISPSS_RET_RST	DSS_RET_RST	PRCM module	Retention reset
	DISPSS_RST	DSS_RST	PRCM module	Nonretention reset

The display subsystem receives its DISPSS_RST reset signal (the reset signal of the display subsystem power domain) from the PRCM module. The DISPSS_RET_RST is used only for the DES_HDCP key protection module and HDMI.

11.1.2.3 Display Subsystem Power Management

The display subsystem modules are in the display subsystem power domain.

[Table 11-9](#) lists the power domains in the display subsystem.

Table 11-9. Display Subsystem Power Domains

Module Instance	Attributes
	Power Domain
Display subsystem	PD_DSS
DISPC	For more details, see Section 11.2.1 DISPC Overview , in <i>Display Controller</i> .
HDMI	For more details, see Section 11.3.1 HDMI Overview , in <i>High-Definition Multimedia Interface</i> .

11.1.2.3.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

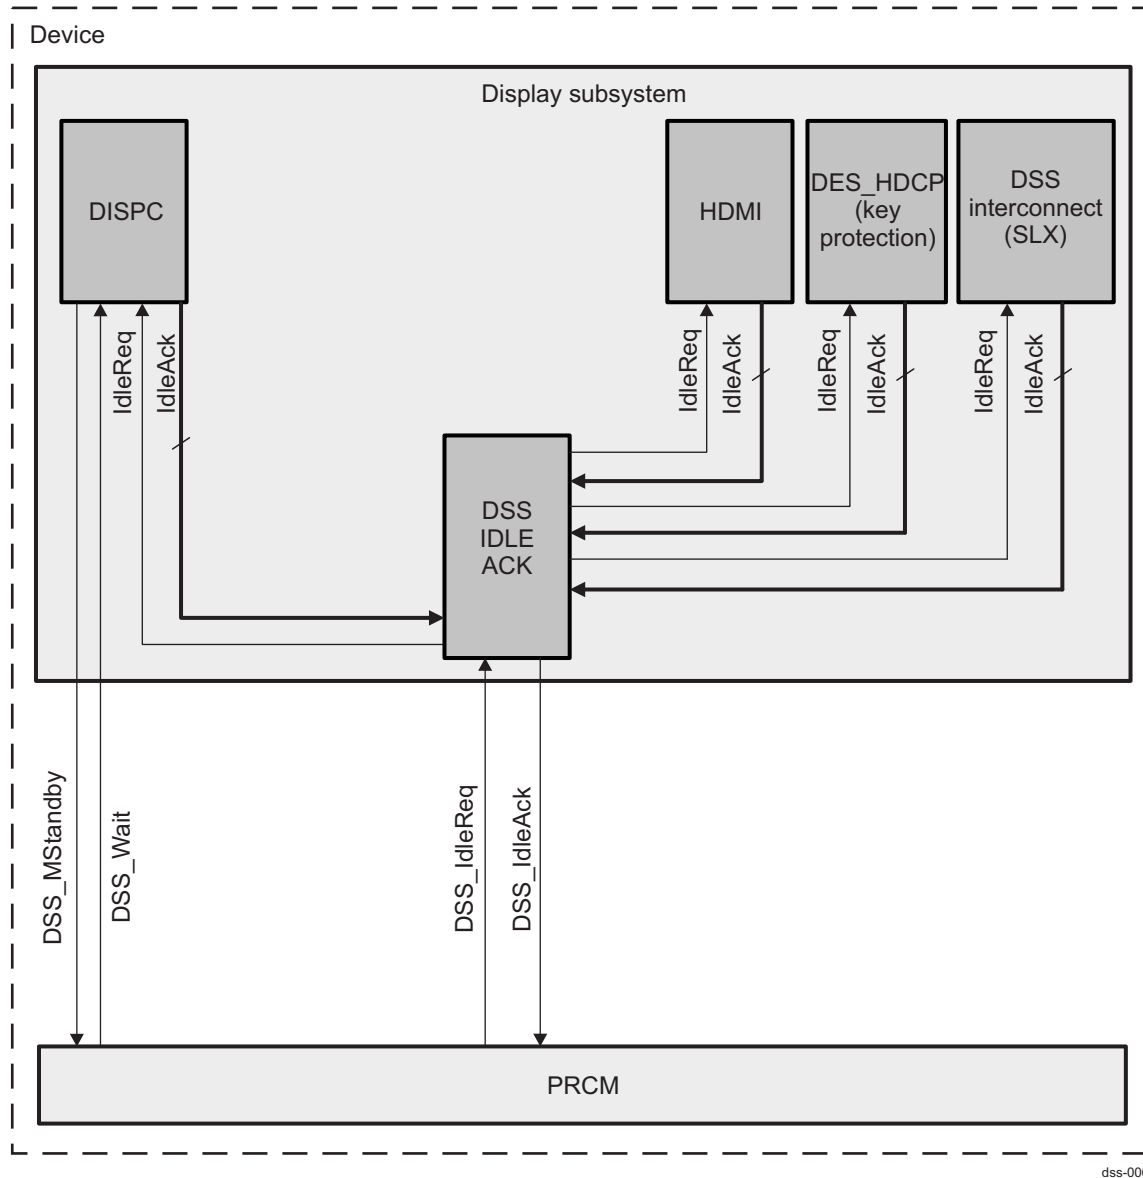

- MStandby/MWait
 - DISPC
- SIdleReq/SIdleAck
 - DISPC
 - HDMI
 - DES_HDCP (key protection)
 - DSS interconnect

The PRCM module asserts the MWait and received MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM module cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see [Section 11.2.1 DISPC Overview](#), in *Display Controller*.

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

[Figure 11-6](#) shows the generation of SIdleAck/MStandby in the display subsystem.

Figure 11-6. Display Subsystem SIdleAck/MStandby Generation

dss-006

11.1.2.3.2 Display Subsystem Wake-Up Mode

The DISPC and HDMI modules support the wake-up protocol. DSS_HDMI_SWakeUp is associated with HDMI_IRQ, which is generated by the HDMI module. For the events that generate an Swakeup and the description and configuration of the registers, see the DISPC and HDMI TRM chapters.

Figure 11-7 shows wake-up generation in the display subsystem.

Figure 11-7. Display Subsystem Wake-Up Generation

dss-007

11.1.3 Display Subsystem DPLL Controllers Functional Description

11.1.3.1 DPLL Controllers Overview

Two PLL controller modules are part of the display subsystem. They use the SCP and power-management port (PMP) as the primary interfaces. The SCP interface sets the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP controls the power state of the DPLL and HSDIVIDER modules. [Figure 11-8](#) is an overview of a single DPLL_VIDEO controller module in the display subsystem. For more information on DPLL_HDMI control, see [Section 11.1.3.4, DPLL_HDMI](#).

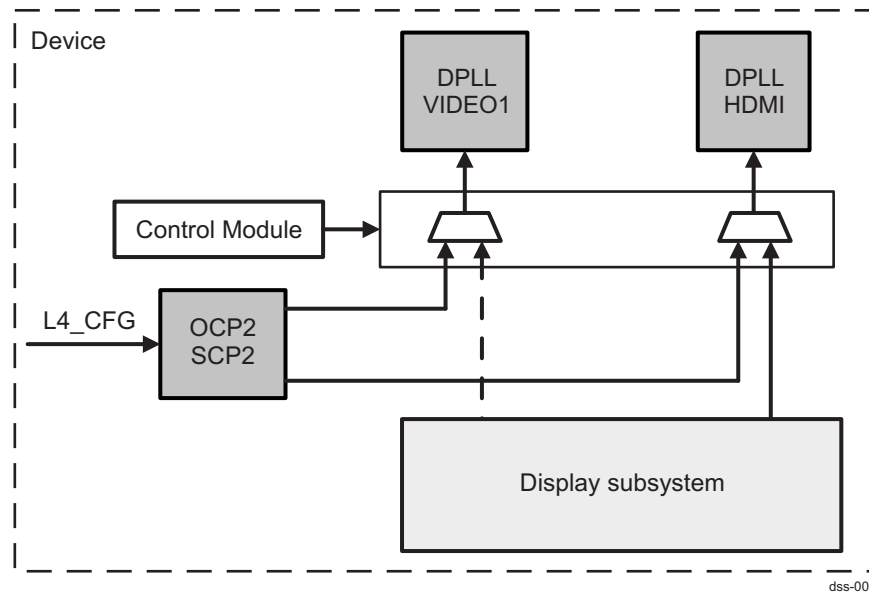

Figure 11-8. PLL Controller Overview

11.1.3.2 OCP2SCP2 Functional Description

In case DSS module is not used, DPLL_VIDEO1 and DPLL_HDMI can be still used to source other modules in the device. The OCP2SCP2 module, which serves as a L4_CFG interconnect adapter, lets user software configure the PLLCTRL for DPLL_VIDEO1 and DPLL_HDMI registers over the L4_CFG port. Figure 11-9 is an overview of the OCP2SCP2 bridge interface.

Figure 11-9. OCP2SCP2 Overview

NOTE: Selection of how DPLLs are controlled is done through registers `DSS_PLL_CONTROL[0]`, `PLL_VIDEO1_DSS_CONTROL_DISABLE` and `DSS_PLL_CONTROL[2]`, `PLL_HDMI_DSS_CONTROL_DISABLE` of the device Control Module. For more information, see [Chapter 18, Control Module](#).

11.1.3.2.1 OCP2SCP2 Reset

11.1.3.2.1.1 Hardware Reset

The module receives an asynchronous hardware reset (L3INIT_RST) upon power-on reset (POR) at its active low PIRSTNA input. For more information on the hardware reset source, see [Section 3.5.5, Reset Domains](#), in [Chapter 3, Power, Reset, and Clock Management](#).

11.1.3.2.1.2 Software Reset

Setting the [OCP2SCP_SYSCONFIG\[1\] SOFTRESET](#) bit to 1 triggers a software reset on the OCP2SCP2 interconnect adapter. The [OCP2SCP_SYSSTATUS\[0\] RESETDONE](#) bit is used by software to monitor the status of reset completion. Hardware keeps this bit at 0 while the reset is being executed. A RESETDONE bit transition from 0 to 1 indicates the OCP2SCP2 reset is complete.

11.1.3.2.2 OCP2SCP2 Power Management

The OCP2SCP2 features idle acknowledgement protocol with the PRCM.

11.1.3.2.2.1 Idle Mode

The smart-idle mode supported by OCP2SCP2 is not wakeup capable, meaning that software should explicitly take care to wake the OCP2SCP2, setting the [OCP2SCP_SYSCONFIG\[4:3\] IDLEMODE](#) bit field to 0x1 (no-idle), once it has previously gone to an idle mode. For more information, see [Section 3.1.1.1.4, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: Software must get the OCP2SCP2 module out of IDLE state by setting the [OCP2SCP_SYSCONFIG\[4:3\] IDLEMODE](#) bit field to 0x1, once smart-idle mode has been selected ([OCP2SCP_SYSCONFIG\[4:3\] IDLEMODE](#) = 0x2).

11.1.3.2.2.2 Clock Gating

OCP2SCP2 module has a local support for an automatic clock gating based on L4_CFG interconnect activity. This feature is enabled by setting the [OCP2SCP2\[0\] AUTOIDLE](#) bit to 0x1, otherwise the module interface clock is free running. For more information, see [Section 3.6.4.1.4, Clock Domain-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

11.1.3.2.3 OCP2SCP2 Timing Registers

The timing configuration register sets various parameters controlling the timing constraints of the OCP2SCP2 module. The division ratio between the L4_CFG interconnect clock - L3INIT_L4_GICLK and the serial configuration port output clock is set through the [OCP2SCP_TIMING\[9:7\] DIVISIONRATIO](#) bit field, with a valid range of 0x1 to 0x7. The [OCP2SCP_TIMING\[6:4\] SYNC1](#) timing information is programmable in the range 0 to 7 clock cycles, and shows the acceptable delay between the enable and command availability on SCP. The value of [OCP2SCP_TIMING\[3:0\] SYNC2](#) is also programmable in the range 1 to 15 clock cycles, measured from the moment the command is available on SCP until data is accessible.

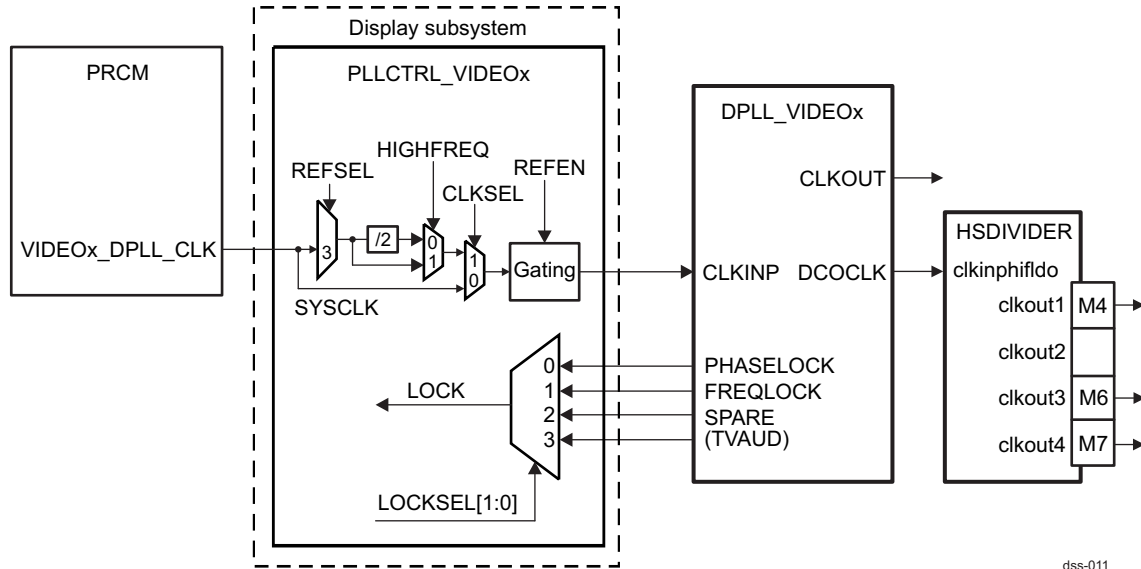

11.1.3.3 DPLL_VIDEO Functional Description

11.1.3.3.1 DPLL_VIDEO Controller Architecture

VIDEO1 PLL use type-A instances of the DPLL modules. For information regarding DPLL types, see [Chapter 3, PRCM](#).

[Figure 11-10](#) shows the internal reference diagram of a single VIDEO PLL.

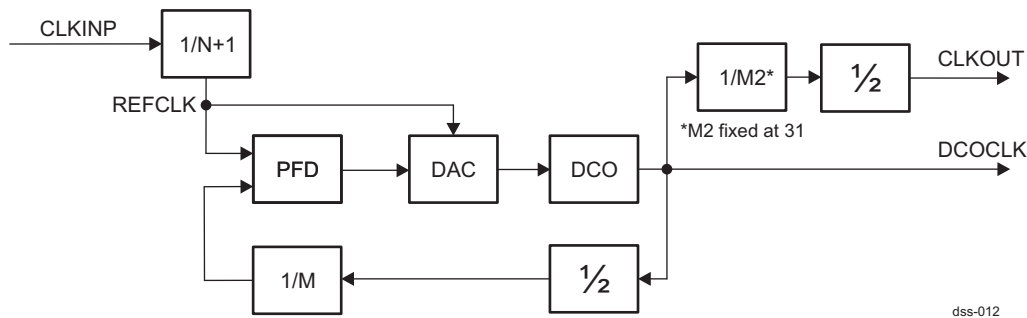

Figure 11-10. VIDEO PLL Reference Diagram

Reference clock control is enabled with [PLL_CONFIGURATION2](#)[13] PLL_REFEN bit.

Figure 11-11 is a simplified block diagram of the DPLL_VIDEO instance used for pixel clock generation.

Figure 11-11. DPLL_VIDEO Functional Block Diagram

The input clock CLKINP goes to a pre-divider $N + 1$. The entire loop runs on the REFCLK clock after this pre-divider. The value of $N + 1$ is controlled through the [PLL_CONFIGURATION1](#)[8:1] PLL_REGN bit field. The CLKINP range is 0.032MHz to 52MHz. The REFCLK range is 0.15MHz to 52MHz.

The output clock DCOCLK is synthesized by a digitally controlled oscillator (the DCO block) that automatically detects the frequency range. The DCOCLK frequency can be given with $DCOCLK = CLKINP \times 2 \times M / (N + 1)$. For that purpose the feedback multiplier M must be configured through the [PLL_CONFIGURATION1](#)[20:9] PLL_REGM bit field.

The CLKOUT frequency can be given with $CLKOUT = DCOCLK / (M2 \times 2) = DCOCLK / 62$. The $M2$ divider value is hardcoded in HW at 31 (0x1F).

11.1.3.3.2 DPLL_VIDEO Operations

The PLL configuration signals operate according to [Table 11-10](#), which indicates the operation when the PLLs are not locked.

Table 11-10. VIDEO PLL Operation Modes When Not Locked

PLL Operation Mode	Stop Mode Low Power ⁽¹⁾	Stop Mode Fast Relock ⁽¹⁾	Idle Bypass
Mode Description	Output clocks stopped Lowest power standby	Output clocks stopped Fastest start-up time	Selects when PLL and HSDIVIDER bypass clocks are used
PLL_CONFIGURATION2[0] PLL_IDLE	0	0	1
PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY	1	0	1

⁽¹⁾ This mode must be used for better performance.

When locked, the PLL output frequency (DCOCLK) is: Input frequency $\times 2 \times M / (N + 1)$, where:

- M multiplier is programmed in the [PLL_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.
- N divider is programmed in the [PLL_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field.

NOTE: When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).

11.1.3.3.3 DPLL_VIDEO Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The [PLL_STATUS\[1\]](#) PLL_LOCK status bit gives the VIDEOx PLL lock state.
- The [PLL_STATUS\[2\]](#) PLL_RECAL status bit informs whether the PLL must be uncalibrated.

11.1.3.3.4 DPLL_VIDEO Software Reset

The VIDEO PLL control module does not have its own software reset. It is reset by the global DSS_RST signal at PRCM module level. See [Section 11.1.2.2, Display Subsystem Resets](#). Nevertheless, software users can monitor the reset status of the VIDEO PLL control module by reading the [PLL_STATUS\[0\]](#) PLLCTRL_RESET_DONE status bits.

11.1.3.3.5 DPLL_VIDEO Power Management

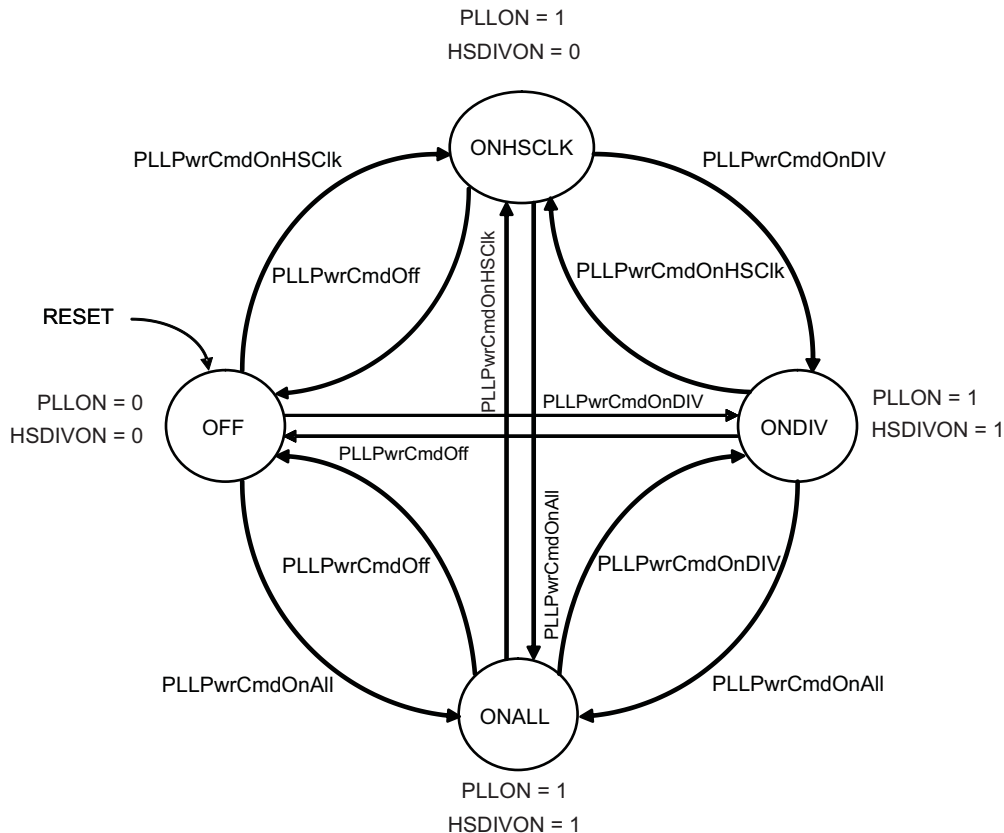

PLLCTRL manages only the LDO power of the DPLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the VIDEO digital phase-locked loop (DPLL) through the PLLCTRL module.

[Figure 11-12](#) shows the power states, which can be controlled through [DSI_CLK_CTRL\[31:30\]](#) PLL_PWR_CMD bit field.

The PLLCTRL power status can be read through the [DSI_CLK_CTRL \[29:28\]](#) PLL_PWR_STATUS bit field.

- OFF power state: PLLCTRL is powered down. Internal clock is off.
- ONHCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL is in active state.

Figure 11-12. VIDEO PLL Power State Diagram

dss-014

11.1.3.3.6 DPLL_VIDEO HSDIVIDER Loading Operation

In manual mode (`PLL_CONTROL[0] PLL_AUTOMODE = 0`), it is possible to update the configuration values of HSDIVIDER without starting the DPLL locking sequence. Once all the configuration values have been programmed into the registers, the `PLL_GO[1] HSDIVLOAD` bit must be set. The `TENABLEDIV` output is driven high for six SCP clock periods while the `TINITZ` and `TENABLE` signals remain unchanged. The `HSDIVLOAD` bit is cleared at the end of the sequence.

The `SCPBUSY` signal is high during the sequence until the `HSDIVLOAD` bit is cleared, thus indicating that there is pending activity in the `SCPClk` domain. `SCPClk` must be kept running while this signal is asserted.

The HSDIVIDER sequence and the GO sequence cannot be performed at the same time. If one of the two sequences is running and the trigger bit of the other sequence is set, `PLLCTRL` finishes the first sequence and then immediately starts the other sequence.

11.1.3.3.7 DPLL_VIDEO Clock Sequence

The VIDEO PLL generates `DCOCLK` clock to a dedicated HSDIVIDER, which outputs three clocks (`clkout1`, `clkout3`, `clkout4`). If these three clocks are not used, the HSDIVIDER functions are not required.

In addition, a `CLKOUT` clock is also generated. It is output directly, and does not go through HSDIVIDER.

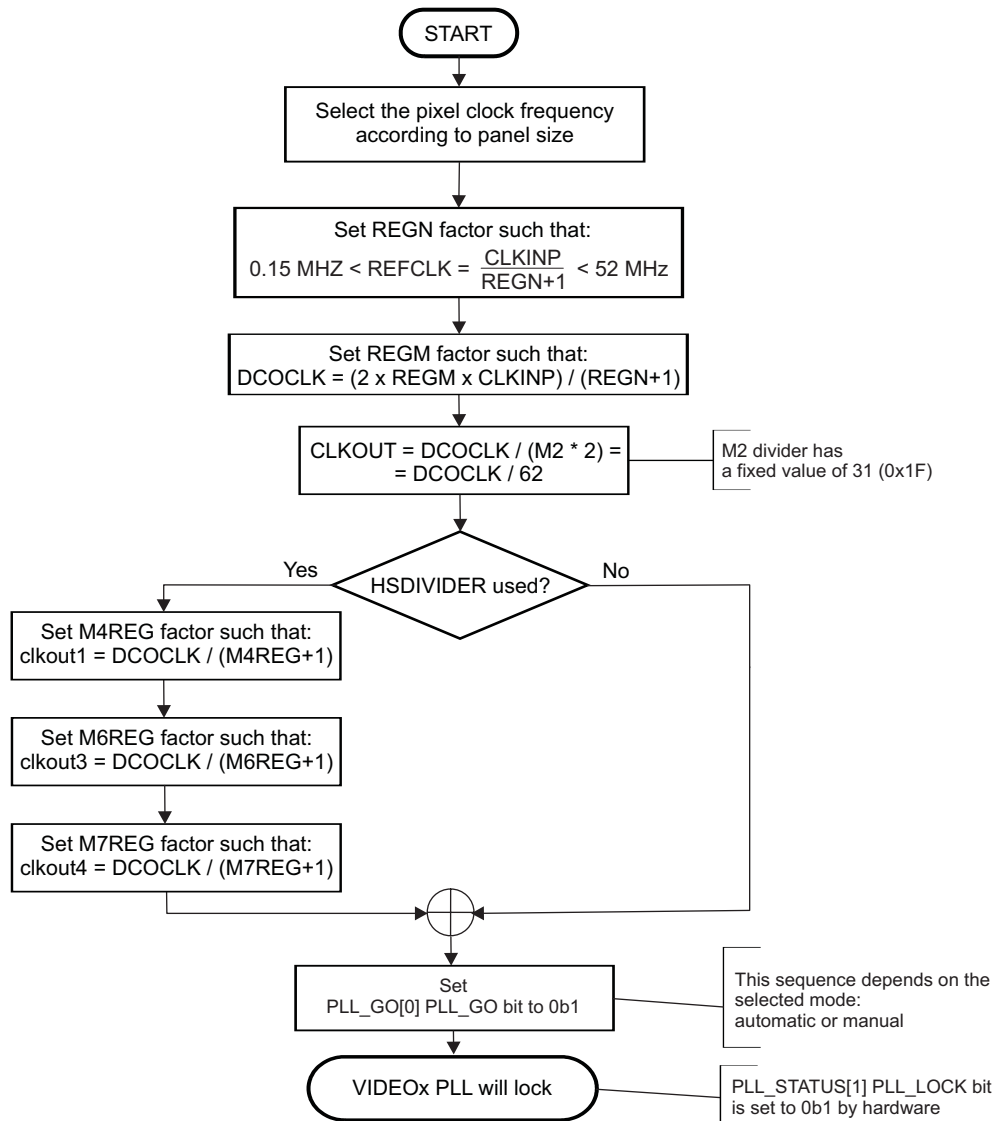

The following must be considered for [Figure 11-13](#):

- REGM factor is programmed by the `PLL_CONFIGURATION1[20:9] PLL_REGM` bit field. It is used to tune `DCOCLK` clock.
- REGN factor is programmed by the `PLL_CONFIGURATION1[8:1] PLL_REGN` bit field. It is used to tune `DCOCLK` clock.
- M4REG factor is programmed by the `PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV` bit field, and applies to `clkout1` of the DPLL_VIDEO HSDIVIDER.

- M6REG factor is programmed by the [PLL_CONFIGURATION3\[4:0\]](#) M6_CLOCK_DIV bit field, and applies to clkout3 of the DPLL_VIDEO HSDIVIDER.
- M7REG factor is programmed by the [PLL_CONFIGURATION3\[9:5\]](#) M7_CLOCK_DIV bit field, and applies to clkout4 of the DPLL_VIDEO HSDIVIDER.
- M2 divider is hardcoded in HW at 31 (0x1F), and applies to CLKOUT.

Figure 11-13 shows the programming sequence.

Figure 11-13. VIDEO PLL Programming Sequence

dss-015

NOTE:

- Most of the VIDEO PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended VIDEO PLL values, see [Section 11.1.3.3.9, VIDEO PLL Recommended Values](#).

11.1.3.3.8 DPLL_VIDEO Go Sequence

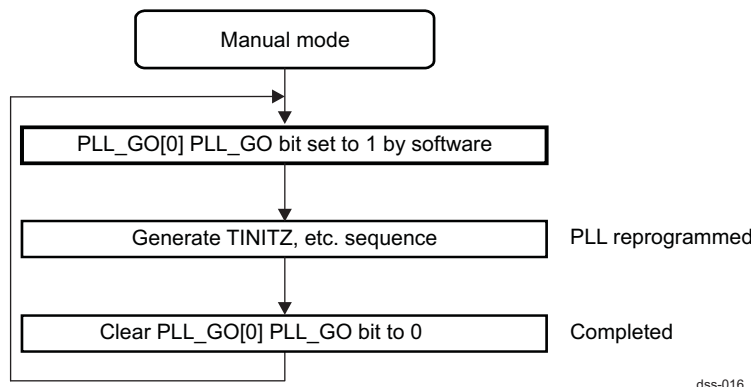

In manual mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL. The [PLL_GO\[0\]](#) PLL_GO bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by setting the [PLL_CONFIGURATION2\[14\]](#) PHY_CLKINEN bit to 0 and assert HSDIVBYPASS correctly by setting the [PLL_CONFIGURATION2\[20\]](#) HSDIVBYPASS bit to 1 to prevent uncontrolled frequencies affecting the display subsystem or the other modules using DPLL_VIDEO during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

[Figure 11-14](#) shows the VIDEO PLL Go flow chart in manual mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 0).

Figure 11-14. VIDEO PLL Go Sequence (Manual Mode)

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

In automatic mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the [PLL_CONFIGURATION2](#) register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

[Figure 11-15](#) shows the VIDEO PLL Go flow chart in automatic mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 1).

Figure 11-15. VIDEO PLL Go Sequence (Automatic Mode)

dss-017

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

11.1.3.3.9 DPLL_VIDEO Recommended Values

Table 11-11 shows the recommended values for PLL configuration.

Table 11-11. DPLL_VIDEO Recommended Programming Values

Field Name	Value	Description
PLL_CONTROL[4] HSDIV_SYSRESET	0	Allow power FSM to control
PLL_CONTROL[3] PLL_SYSRESET	0	Allow power FSM to control
PLL_GO[0] PLL_GO	1→0	Write 1 when PLL is to be (re)locked with new parameters. This bit is cleared by hardware when the PLL request completes.
PLL_CONFIGURATION2[20] HSDIVBYPASS	0	PLL controls HSDIVIDER bypass

Table 11-11. DPLL_VIDEO Recommended Programming Values (continued)

Field Name	Value	Description
PLL_CONFIGURATION2[16] M4_CLOCK_EN or PLL_CONFIGURATION2[23] M6_CLOCK_EN or PLL_CONFIGURATION2[25] M7_CLOCK_EN	1	If PLL/HSDIVIDER is used as the clock source
PLL_CONFIGURATION2[14] PHY_CLKINEN	1	Enable DCOCLK clock
PLL_CONFIGURATION2[13] PLL_REFEN	1	Enable PLL reference
PLL_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase lock criteria to lock the PLL
PLL_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0x0	The RECAL status/interrupt must be used to decide when to perform a PLL uncalibration. No automatic uncalibration is performed.
PLL_CONFIGURATION2[6] PLL_LOWCURRSTDBY	0/1	Set to 0 for fast PLL unlock, but higher standby current. Set to 1 for leakage level standby current, but longer unlock time.
PLL_CONFIGURATION2[5] PLL_PLLLPMODE	0	Normal operation. For smaller display sizes, it may be possible to set to 1.
PLL_CONFIGURATION2[0] PLL_IDLE	0	PLL active

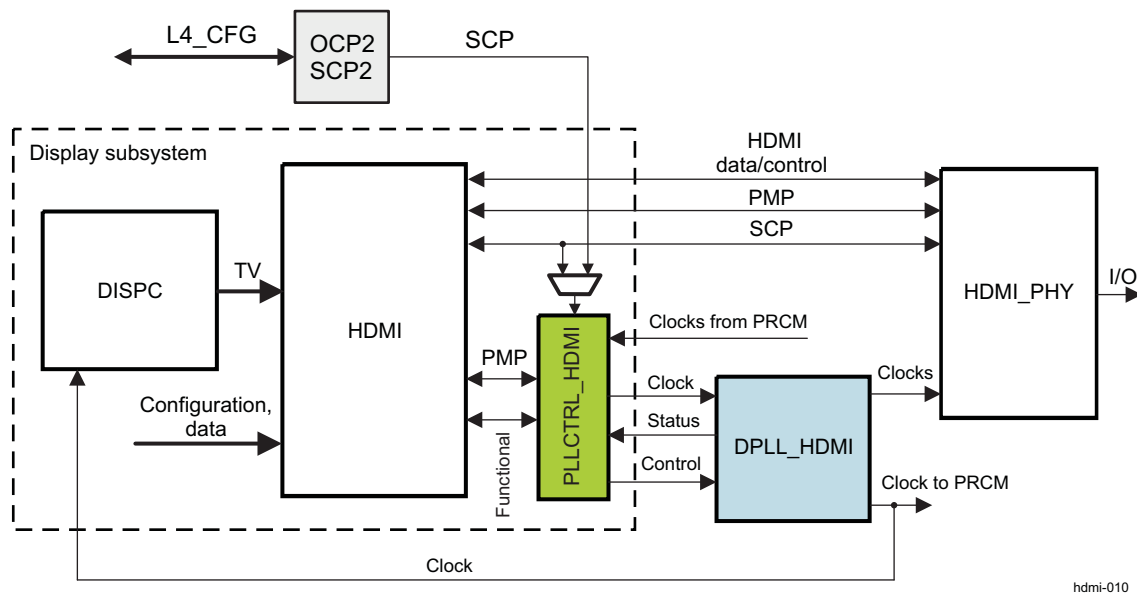

11.1.3.4 DPLL_HDMI Functional Description

11.1.3.4.1 DPLL_HDMI and PLLCTRL_HDMI Overview

The DPLL_HDMI control module (PLLCTRL_HDMI) uses the SCP and PMP as the primary interfaces to the HDMI module. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) module, primarily the various counter values. The PMP is used to control the power state of the DPLL_HDMI module.

Figure 11-16 shows an overview of the PLLCTRL_HDMI and DPLL_HDMI modules in the display subsystem.

Figure 11-16. DPLL_HDMI and PLLCTRL_HDMI Overview

NOTE: The PLLCTRL_HDMI module does not have an interface to L3_MAIN interconnect. The programmable features are managed by registers mapped into the HDMI_WP module.

11.1.3.4.2 DPLL_HDMI and PLLCTRL_HDMI Architecture

The DPLL_HDMI uses instance of the DPLL module of type B. For information regarding DPLL types, see [Chapter 3, PRCM](#).

Figure 11-17 shows the internal reference diagram of the DPLL_HDMI and PLLCTRL_HDMI interconnection in the device.

Figure 11-17. DPLL_HDMI and PLLCTRL_HDMI Reference Diagram

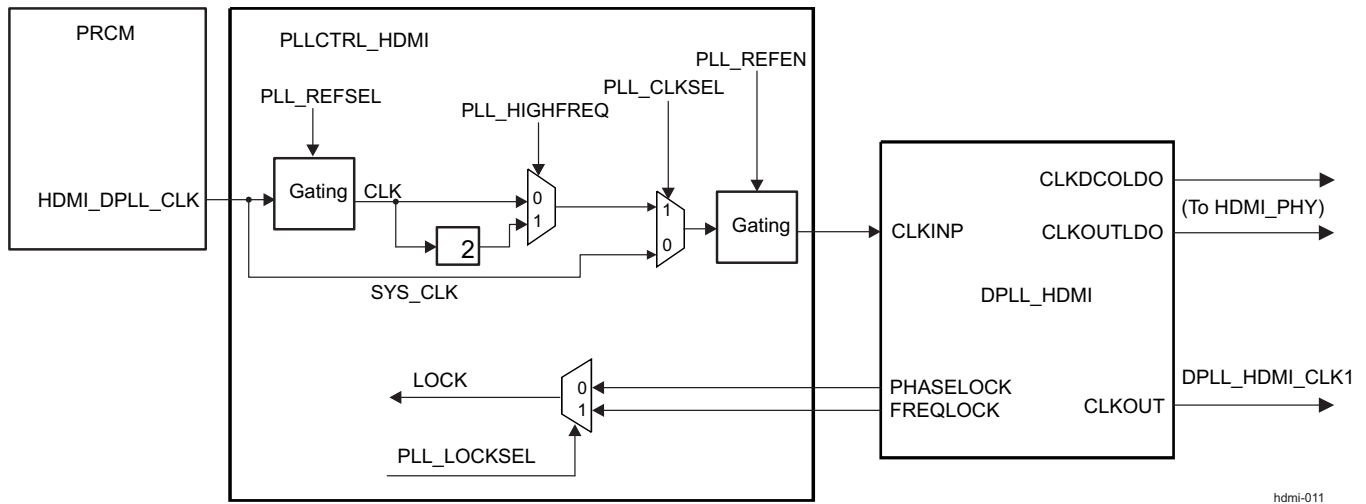

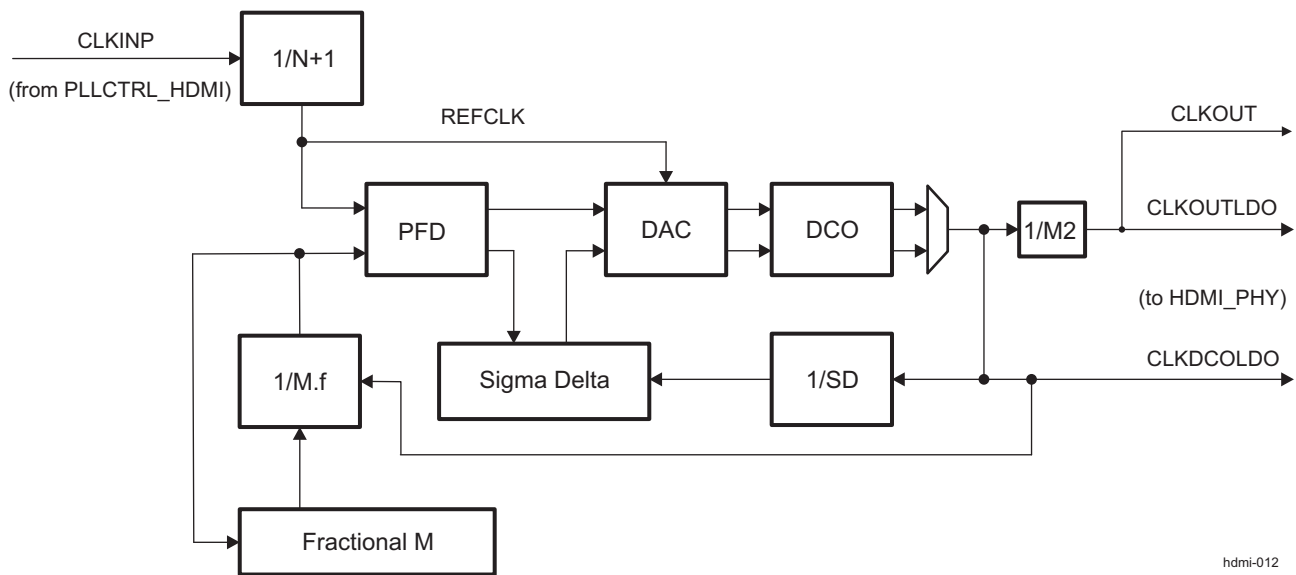

Figure 11-18 shows a simplified block diagram of the DPLL instance used for the DPLL_HDMI.

Figure 11-18. DPLL_HDMI Functional Block Diagram

The DPLL input clock CLKINP goes to a predivider $N + 1$. The entire loop runs on the REFCLK clock after this predivider. The value of $N + 1$ is controlled through the [PLLCTRL_HDMI_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field. The CLKINP range is 0.62 to 60MHz. The REFCLK range is 0.62 to 2.5MHz.

The output clock CLKDCOLDO is synthesized by a digitally controlled oscillator (DCO block). The CLKDCOLDO frequency can be given with $CLKDCOLDO = CLKINP \times M/(N + 1)$. For this purpose, the feedback multiplier M must be configured through the [PLLCTRL_HDMI_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field. The frequency range of the DCO must be selected via the [PLLCTRL_HDMI_CONFIGURATION2\[3:1\]](#) PLL_SELFREQDCO register bit-field depending on the CLKDCOLDO frequency.

The DPLL module supports fractional synthesis. That is, the frequency multiplication factor M can be programmed as fractional. This is done through the use of a sigma-delta feedback divider (M). A fractional value (REGM.f) of 18 bits is supported, thereby enabling control for better accuracy. Programming the fractional value is done by setting the [PLLCTRL_HDMI_CONFIGURATION4\[17:0\]](#) PLL_REGM_F bit field. Fractional synthesis is not supported for $M > 4093$. For integer only division the PLL_REGM_F bit-field must be set to 0x00000.

The programming of the sigma-delta feedback divider is mandatory to get the optimal jitter performance. The value is determined by $PLL_SD = \text{ceiling}((M/(N + 1)) \times CLKINP/250)$, and can be programmed into the [PLLCTRL_HDMI_CONFIGURATION3\[17:10\]](#) PLL_SD register bit-field.

11.1.3.4.3 DPLL_HDMI Operations

NOTE: The DPLL_HDMI must be configured before any transfer on the HDMI link. The HDMI module is fully operational only when the DPLL_HDMI runs and provides the TMDS clock.

The DPLL_HDMI configuration signals operate according to [Table 11-12](#), which indicates the operation when the DPLL is not locked.

Table 11-12. DPLL_HDMI Operation Modes When Not Locked

DPLL_HDMI Operation Mode	Idle Bypass
Mode Description	Selects when DPLL_HDMI Bypass Clocks Are Used
PLLCTRL_HDMI_CONFIGURATION2[0] PLL_IDLE	1

When locked, the DPLL_HDMI output frequency is:

- For CLKOUT output: $[(M+M.f)/(N+1)] \times CLKINP \times [1/M2]$
- For CLKOUTLDO output: $[(M+M.f)/(N+1)] \times CLKINP \times [1/M2]$
- For CLKDCOLDO output: $[(M+M.f)/(N+1)] \times CLKINP$

CLKINP is the input frequency in MHz. The divider and multiplier values in the above formulas can be set through the following registers:

- M frequency multiplier is programmed in the [PLLCTRL_HDMI_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.
- Fractional M (if fractional M divider is required by the use case) is programmed in the [PLLCTRL_HDMI_CONFIGURATION4\[17:0\]](#) PLL_REGM_F bit field
- N divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field.
- M2 divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION4\[24:18\]](#) PLL_REGM2 bit field.
- SD divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION3\[17:10\]](#) PLL_SD bit field.

NOTE: When the PLL_REGM bit field is set to 1, the DPLL enters a MN-Bypass mode. This is a low-power mode, where the DPLL gates its internal clocks and powers down the analog blocks. The CLKDCOLDO and CLKOUTLDO clock outputs go low and remain like that until the DPLL exits MN-Bypass mode (by changing the PLL_REGM bit-field to a value other than 0 or 1).

NOTE: The DPLL_HDMI must be configured before any data transfer to HDMI_PHY.

11.1.3.4.4 DPLL_HDMI Register Access

The configuration registers are accessed through the HDMI module register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

CAUTION

All writes must be 32-bit operations because the SCP interface always transfers 32 bits; 16- or 8-bit operations can lead to unpredictable errors.

11.1.3.4.5 DPLL_HDMI Error Handling

The DPLL_HDMI lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The [PLLCTRL_HDMI_STATUS\[1\]](#) PLL_LOCK bit gives the DPLL_HDMI lock state.
- The [PLLCTRL_HDMI_STATUS\[2\]](#) PLL_RECAL bit informs whether the PLL must be recalibrated.

These signals can also generate interrupts at the HDMI module level.

The PLL reference loss status signal can also be monitored:

- The [PLLCTRL_HDMI_STATUS\[3\]](#) PLL_LOSSREF bit informs whether the DPLL_HDMI has lost the reference clock.

11.1.3.4.6 DPLL_HDMI Software Reset

The PLLCTRL_HDMI module does not have its own software reset. It is reset by the HDMI module. Nevertheless, the reset status of the PLLCTRL_HDMI module can be monitored by reading the [PLLCTRL_HDMI_STATUS\[0\]](#) PLLCTRL_RESET_DONE bit.

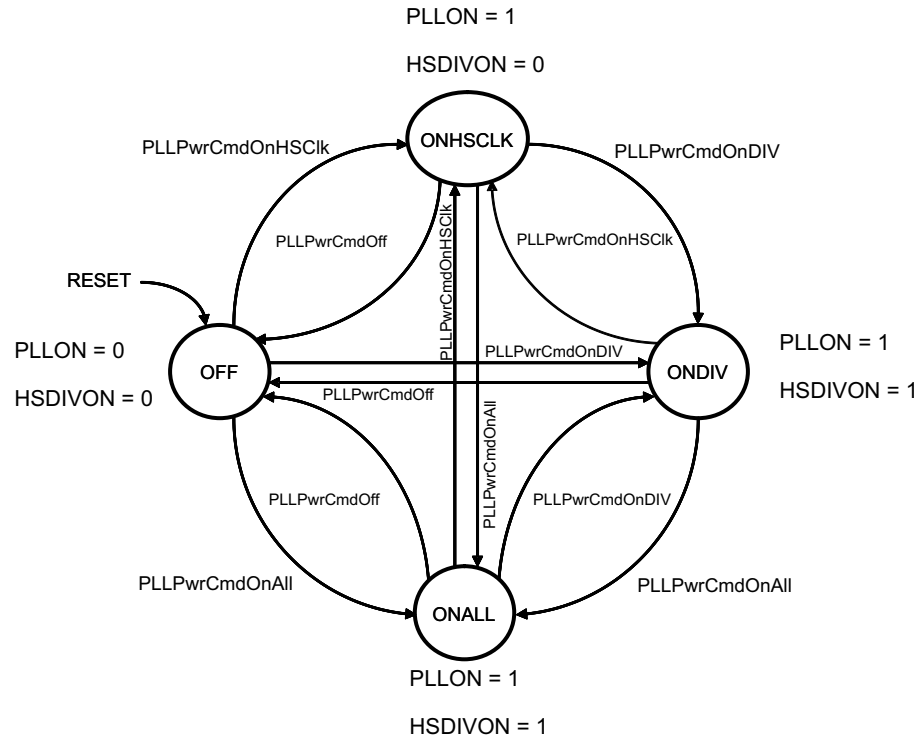

11.1.3.4.7 DPLL_HDMI Power Management

The PLLCTRL_HDMI manages only the LDO power of the DPLL_HDMI. This is done by overriding the SYSRESET signal. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the HDMI_DPLL through the PLLCTRL_HDMI module.

[Figure 11-19](#) shows the power states, which can be controlled through [HDMI_WP_PWR_CTRL\[3:2\]](#) PLL_PWR_CMD bit field.

The PLLCTRL_HDMI power status can be read through the [HDMI_WP_PWR_CTRL\[1:0\]](#) PLL_PWR_STATUS bit field.

Figure 11-19. PLLCTRL_HDMI Power State Diagram

hdmi-048

- OFF power state: PLLCTRL_HDMI is powered down. Internal clock is off.
- ONHCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL_HDMI is in active state.

11.1.3.4.8 DPLL_HDMI Lock Sequence

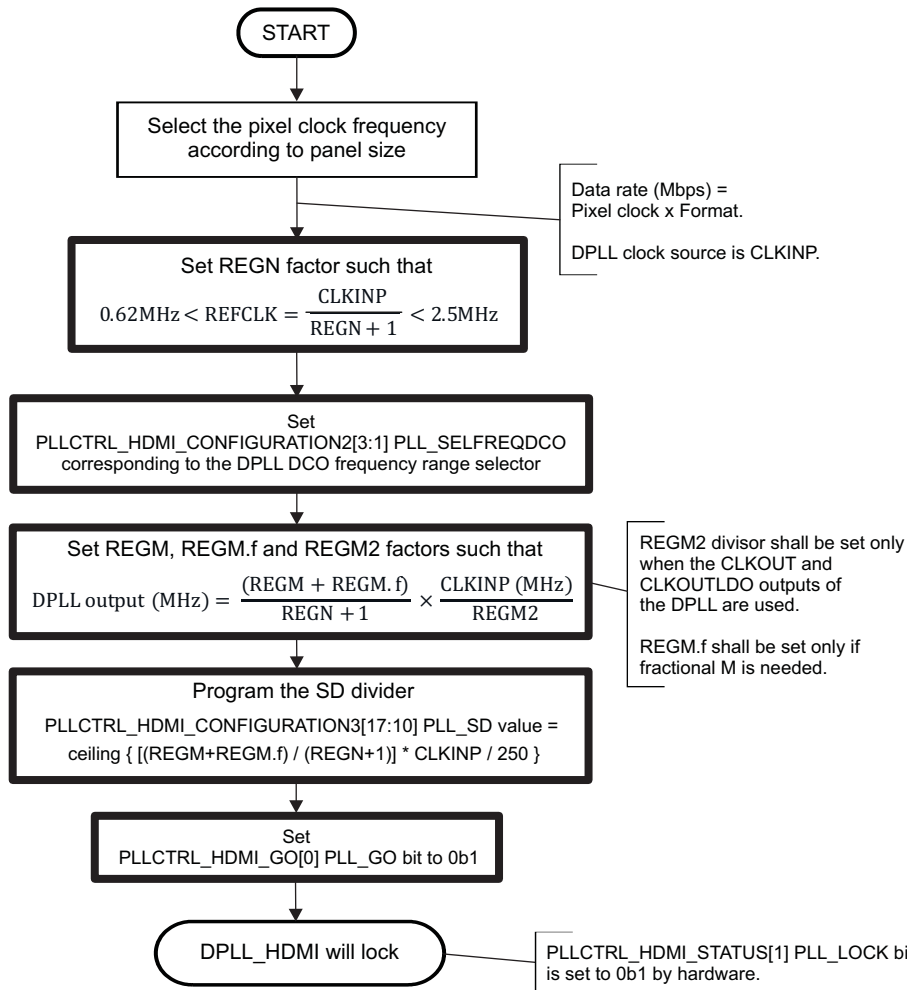

The DPLL_HDMI generates the clocks to the HDMI_PHY module and the DPLL_HDMI_CLK1 clock used by the DISPC and various system modules.

The DPLL_HDMI factors must be calculated based on the required input and output frequencies, keeping the DPLL_HDMI internal reference frequency in the appropriate range:

- REGM factor is programmed in the [PLLCTRL_HDMI_CONFIGURATION1](#)[20:9] PLL_REGM bit field.
- REGM.f factor (if fractional M divider is required by the use case) is programmed in the [PLLCTRL_HDMI_CONFIGURATION4](#)[17:0] PLL_REGM_F bit field.
- REGN factor is programmed in the [PLLCTRL_HDMI_CONFIGURATION1](#)[8:1] PLL_REGN bit field.
- REGM2 factor is programmed in the [PLLCTRL_HDMI_CONFIGURATION4](#)[24:18] PLL_REGM2 bit field.
- SD divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION3](#)[17:10] PLL_SD bit field.

Figure 11-20 shows the programming sequence.

Figure 11-20. DPLL_HDMI Programming Sequence

hdmi-014

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Table 11-13 summarizes the registers for the DPLL_HDMI programming sequence.

Table 11-13. DPLL_HDMI Register Call Summary for HDMI PLL Programming Sequence

Register Name	Register Name	Register Name	Register Name	Register Name
PLLCTRL_HDMI_CONFIGURATION2	PLLCTRL_HDMI_GO	PLLCTRL_HDMI_STATUS	PLLCTRL_HDMI_CONFIGURATION3	PLLCTRL_HDMI_CONFIGURATION4

NOTE: The following should be considered for the programming sequence in [Figure 11-20](#):

- The equation for the DPLL output applies to both CLKDCOLDO and CLKOUTLDO outputs of the DPLL_HDMI. The REGM2 divisor value must be considered only in case the CLKOUTLDO frequency needs to be calculated. Programming of REGM.f is needed only if fractional M divider is required by the use case.
- The DPLL_HDMI_CLK1 clock is sourced from the CLKDCOLDO output of the DPLL_HDMI:
 - The DPLL_HDMI_CLK1 frequency must be a multiple of the PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
 - The DPLL_HDMI_CLK1 frequency must be lower than 186 MHz.
- The [PLLCTRL_HDMI_CONFIGURATION2\[3:1\]](#) PLL_SELFREQDCO register bit field should be programmed depending on the value of CLKDCOLDO = CLKINP × M/(N + 1). See [Section 11.1.3.4.3, DPLL_HDMI Operations](#).
- Programming of other DPLL_HDMI parameters is available for software flexibility, but it is not recommended to update their values in normal use. For the recommended DPLL_HDMI values, see [Section 11.1.3.4.10, DPLL_HDMI Recommended Values](#).

11.1.3.4.9 DPLL_HDMI Go Sequence

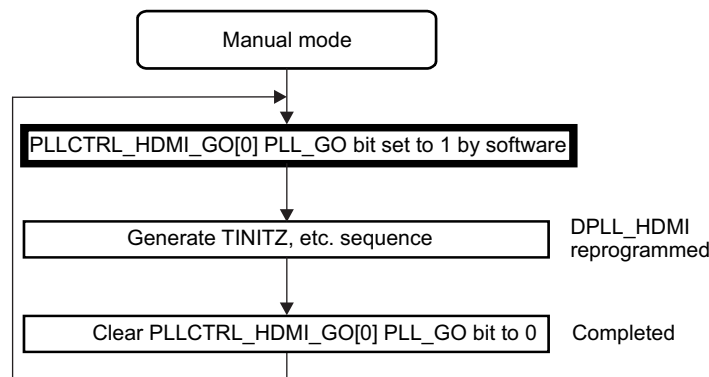

The DPLL_HDMI controller works in manual mode. In this mode the DPLL_HDMI requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL_HDMI. The [PLLCTRL_HDMI_GO\[0\]](#) PLL_GO bit is cleared to 0 at the end of the sequence.

In this mode, software must deassert CLKINEN by resetting the [PLLCTRL_HDMI_CONFIGURATION2\[14\]](#) PHY_CLKINEN bit to 0 to prevent uncontrolled frequencies affecting HDMI_PHY and the display subsystem during DPLL_HDMI locking.

[Figure 11-21](#) shows the PLLCTRL HDMI GO flow chart in manual mode.

Figure 11-21. DPLL_HDMI GO Sequence (Manual Mode)

hdmi-015

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

11.1.3.4.10 DPLL_HDMI Recommended Values

[Table 11-14](#) lists the main DPLL_HDMI and PLLCTRL_HDMI recommended values.

Table 11-14. DPLL_HDMI Recommended Programming Values

Field Name	Value	Description
PLLCTRL_HDMI_GO [0] PLL_GO	1 - 0	Write 1 when DPLL_HDMI is to be (re)locked with new parameters. This bit is cleared to 0 by hardware when the DPLL_HDMI request completes.
PLLCTRL_HDMI_CONFIGURATION1 [20:9] PLL_REGM	See ⁽¹⁾	DPLL_HDMI feedback clock divider.
PLLCTRL_HDMI_CONFIGURATION4 [17:0] PLL_REGM_F	See ⁽¹⁾	Fractional part of the DPLL_HDMI feedback clock divider. Must be kept at 0, if integer divider only will be used.
PLLCTRL_HDMI_CONFIGURATION1 [8:1] PLL_REGN	See ⁽¹⁾	DPLL_HDMI reference clock divider.
PLLCTRL_HDMI_CONFIGURATION2 [15] BYPASSEN	0	When this bit is 0, the CLKOUT clock depends on the DPLL_HDMI configuration (DPLL locked). For small displays, it may be possible to use the functional clock, in which case this bit must be set to 1. When 1, the internal DPLL_HDMI configuration path is bypassed, and CLKINP is sent on the CLKOUT output.
PLLCTRL_HDMI_CONFIGURATION2 [14] PHY_CLKINEN	1	Enable DPLL_HDMI clock output to HDMI_PHY.
PLLCTRL_HDMI_CONFIGURATION2 [13] PLL_REFEN	1	Enable the DPLL_HDMI reference clock.
PLLCTRL_HDMI_CONFIGURATION2 [10:9] PLL_LOCKSEL	0x0	Phase-lock criteria to lock the DPLL_HDMI.
PLLCTRL_HDMI_CONFIGURATION2 [8] PLL_DRIFTGUARDEN	0	The RECAL status/interrupt must be used to decide when to perform a DPLL_HDMI uncalibration. No automatic uncalibration is performed.
PLLCTRL_HDMI_CONFIGURATION2 [3:1] PLL_SELFREQDCO	See ⁽¹⁾	Must be programmed based on the DPLL_HDMI lock frequency.
PLLCTRL_HDMI_CONFIGURATION2 [0] PLL_IDLE	0	DPLL_HDMI active.
PLLCTRL_HDMI_CONFIGURATION3 [17:10] PLL_SD	See ⁽¹⁾	$\text{Sigma-delta divider} = \text{ceiling} \left\{ \frac{[\text{PLL_REGM} / (\text{PLL_REGN} + 1)] * \text{CLKINP}(\text{MHz})}{250} \right\}$

⁽¹⁾ The value of the bit field must be set according to the desired clock frequency.

11.1.4 Display Subsystem Programming Guide

This section provides recommended steps for initializing the DSS module.

Table 11-15. DSS Initialization Sequence

Step	Register / Bit Field / Chapter	Value
Enable DSS clock domain		
Configure DPLL_PER and associated HS12 divider, according to the desired DSS_GFCLK frequency	Refer to Chapter 3 , section <i>DPLL_PER Description</i>	-
Enable DES_HDCP clock	Set CTRL_CORE_CONTROL_IO_2[0] DSS_DESHDCP_CLKEN register bit; Refer to Section 18.5 , <i>Control Module Register Manual</i>	0x1
Set SW wake-up transition for DSS clock domain	Set CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL register bitfield; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x2
Enable (ungate) DSS_GFCLK clock	Set CM_DSS_DSS_CLKCTRL[8] OPTFCLKEN_DSSCLK register bit; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x1
Enable DSS clocks	Set CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE register bitfield; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x2
Wait for DSS idle status (functional or in idle mode)	Read CM_DSS_DSS_CLKCTRL[17:16] IDLEST register bit-field; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x0 or 0x2
Make DSS DPLLs accessible via DSS address space		
Make VIDEO1 and HDMI DPLLs accessible via DSS	Clear the following bits in CTRL_CORE_DSS_PLL_CONTROL register: [2] PLL_HDMI_DSS_CONTROL_DISABLE bit; [0] PLL_VIDEO1_DSS_CONTROL_DISABLE bit; Refer to Section 18.5 , <i>Control Module Register Manual</i>	0x0
Enable DSS internal SCP interface		
Enable DSS internal SCP interface for VIDEO1 register configuration	Set DSI_CLK_CTRL [14] CIO_CLK_ICG register bit	0x1
Configure DSS internal SCP interface for HDMI DPLL register configuration	Set HDMI_WP_CLK [10:8] SCP_PWR_DIV register bit-field	0x-
Configure DSS DPLLs		
Enable (ungate) VIDEO1 and HDMI DPLLs source clocks	Set the following bits in CM_DSS_DSS_CLKCTRL register: [12] OPTFCLKEN_VIDEO1_CLK bit; [10] OPTFCLKEN_HDMI_CLK bit; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x1
Proceed with VIDEO1 and HDMI DPLLs configuration	Refer to Section 11.1.3 , <i>Display Subsystem DPLL Controllers Functional Description</i>	-

RESERVED																DIVISIONRATIO		SYNC1			SYNC2										

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Reserved.	R	0x00 0000
9:7	DIVISIONRATIO ⁽¹⁾	Division Ratio of the SCP clock in relation to OCP input clock.	RW	0x0
6:4	SYNC1	Number of SCPclock cycles defining SYNC1	RW	0x0
3:0	SYNC2	Number of SCPclock cycles defining SYNC2	RW	0x1

⁽¹⁾ When value "000" is programmed for the SCP clock division ratio, and the transaction to be made is a valid transaction on the SCP interface, the DIVISIONRATIO value is set internally to 0x7 (to avoid a block on the OCP interface).

Bits	Field Name	Description	Type	Reset
31:17	RESERVED	Reads as zero.	R	0x0000
16	PLL_TICOPWDN	PLL TICOPWDN status. Read 0x1: Internal oscillator power down Read 0x0: Internal oscillator power up	R	0
15	PLL_LDOPWDN	PLL LDOPWDN status. Read 0x1: PLL's internal LDO is power down Read 0x0: PLL's internal LDO is power up	R	0
14:13	BYPASSACKZ	State of bypass mode on PHY and HSDIVIDER. The status is shown separately for each source. Read 0x1: PLL outputs are still being used by the PHY or HSDIVIDER. Read 0x0: PHY or HSDIVIDER has switched to using the bypass clocks.	R	0x0
12	SSC_EN_ACK	Spread Spectrum Clocking acknowledge Read 0x1: Spread Spectrum Clocking active Read 0x0: Spread Spectrum Clocking inactive Note: SSC feature is not supported.	R	0
11	M7_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x0: M7 clock inactive Read 0x1: M7 clock active	R	0x0
10	M6_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x1: M6 clock active Read 0x0: M6 clock inactive	R	0
9	BYPASSACKZ_MERGED	Merged state of bypass mode on PHY and HSDIVIDER Read 0x1: PLL outputs are still being used by the PHY or HSDIVIDER Read 0x0: PHY and HSDIVIDER have switched to using the bypass clocks.	R	0
8	RESERVED	Reads as zero.	R	0x0000

Bits	Field Name	Description	Type	Reset
7	M4_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x1: M4 clock active Read 0x0: M4 clock inactive	R	0
6	PLL_BYPASS	PLL Bypass status Read 0x1: PLL bypass Read 0x0: PLL not bypassing	R	0
5	PLL_HIGHJITTER	PLL High Jitter status Read 0x1: PLL in high jitter condition: Phase error > 24% Read 0x0: PLL in normal jitter condition	R	0
4	RESERVED	Read returns zero.	R	0
3	PLL_LOSSREF	PLL Reference Loss status Read 0x1: Reference input inactive Read 0x0: Reference input active	R	0
2	PLL_RECAL	PLL re-calibration status If this bit is active, the PLL needs to be re-calibrated Read 0x1: Recalibration is required Read 0x0: Recalibration is not required	R	0
1	PLL_LOCK	PLL Lock status See the programming guide for the use of this bit Read 0x1: PLL is locked Read 0x0: PLL is not locked	R	0
0	PLLCTRL_RESET_DONE	PLLCTRL reset done status Read 0x1: Reset has completed Read 0x0: Reset is in progress	R	0

Address Offset	0x0000 000C	Instance	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4
Physical Address	0x5800 430C 0x4A0A 400C		
Description	This register contains the latched PLL and HSDIVIDER configuration bits		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	RESERVED					M4_CLOCK_DIV				PLL_REGM								PLL_REGN					RESERVED								

Bits	Field Name	Description	Type	Reset
31	RESERVED	Read returns zero.	R	0
30:26	RESERVED	Reserved	R	0x0000
25:21	M4_CLOCK_DIV	Divider value for clock source M4REG Divider value = M4_CLOCK_DIV + 1	RW	0x00
20:9	PLL_REGM	M Divider for PLL. Valid values range is from 1 to 2047. Values 2048 and above are reserved and must not be used. When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).	RW	0x000
8:1	PLL_REGN	N Divider for PLL (Reference). Divider value = PLL_REGN+1. Valid values range is from 0 to 127. Values 128 and above are reserved and must not be used.	RW	0x00
0	RESERVED	Read returns zero.	R	0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED	Read as zero.	R	0x00
25	M7_CLOCK_EN	Enable for M7 clock source 0x0: M7 clock divider is disabled 0x1: M7 clock divider is enabled	RW	0x0
24	RESERVED	Read returns zero.	R	0
23	M6_CLOCK_EN	Enable for M6 clock source 0x0: M6 clock divider is disabled 0x1: M6 clock divider is enabled	RW	0
22:21	REFSEL	Selects the reference clock with optional divide by 2 0x0: Reserved 0x1: Reserved 0x3: Select SYSCLK reference 0x2: Reserved	RW	0x0
20	HSDIVBYPASS	Forces HSDIVIDER to bypass mode 0x0: HSDIVIDER in normal operation. Bypass controlled by PLL. 0x1: HSDIVIDER forced to bypass mode.	RW	0
19	RESERVED	Read returns zero.	R	0
18	RESERVED	Read returns zero.	R	0
17	RESERVED	Read returns zero	R	0
16	M4_CLOCK_EN	Enable for M4 clock source 0x0: Sub-system clock divider is disabled 0x1: Sub-system clock divider is enabled	RW	0

Bits	Field Name	Description	Type	Reset
15	BYPASSEN	Selects sub-system functional clock as PHY clock source 0x0: PLL controls the PHY clock source: PLL DCO if PLL is locked Sub-system functional clock if not locked 0x1: Force sub-system functional clock to be used as the PHY clock source	RW	0
14	PHY_CLKINEN	PHY clock control 0x0: PHY clock is disabled 0x1: PHY clock is enabled	RW	0
13	PLL_REFEN	PLL reference clock control 0x0: PLL reference clock disabled 0x1: PLL reference clock enabled	RW	1
12	PLL_HIGHFREQ	Enables a division of pixel clock by 2 before input to the PLL Required for pixel clock frequencies above 32 MHz (21 MHz if N = 0) 0x0: Pixel clock is not divided 0x1: Pixel clock is divided by 2	RW	0
11	PLL_CLKSEL	Reference clock selection 0x0: Selects SYSCLK as PLL reference clock 0x1: Selects Pixel Clock (PCLK) as PLL reference clock	RW	0
10:9	PLL_LOCKSEL	Selects the lock criteria for the PLL 0x0: Phase Lock 0x1: Frequency Lock 0x2: Spare	RW	0x0
8	PLL_DRIFTGUARDEN	PLL DRIFTGUARDEN 0x0: Only RECAL flag is asserted in case of temperature drift. The programmer should take appropriate action. 0x1: Temperature drift will initiate automatic recalibration. RECAL flag will be asserted while this is taking place.	RW	0
7	RESERVED		R	0
6	PLL_LOWCURRSTBY	PLL LOW CURRENT STANDBY 0x0: LOWCURRSTBY is not selected 0x1: LOWCURRSTBY is selected	RW	0
5	PLL_PLLLPMODE	Select the power / performance of the PLL 0x0: Full performance, minimized jitter 0x1: Reduced power, increased jitter	RW	0
4	RESERVED	Reads as zero.	R	0
3:1	RESERVED	Reserved	R	0
0	PLL_IDLE	PLL IDLE: 0x0: IDLE is not selected 0x1: IDLE is selected	RW	0

RESERVED																SCP_PWR_DIV		RESERVED													

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x00 0000
10:8	SCP_PWR_DIV	Defines the divisor value to be used for the generation of the SCP_PWR clock (up to 66.5MHz) from the input interface clock (up to 266MHz). 0x0 means gated 0x1 means free-running The valid values are from 0 to 7. In case of interface access to register through SCP interface, if the SCP_PWR clock is gated, the HW automatically generates the clock by using a divisor of 7 and updates the bit-field with the value 7. It is then software responsibility to change the value at any time in order to improve SCP latency when accessing the registers in the HDMI_PHY and PLLCTRL_HDMI by reducing the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
7:0	RESERVED		R	0x0

11.2 Display Controller

11.2.1 DISPC Overview

[Figure 11-22](#) shows a block diagram of the display controller (DISPC) within the display subsystem.

Figure 11-22. DISPC Overview

disp-064

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

The DISPC includes the following main features:

- Five pipelines for processing:
 - One Graphics (GFX):
 - Pixel formats: ARGB16-4444, xRGB12-4444, RGBA16-4444, RGBx12-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, xRGB24-8888, RGBx24-8888, BGRA32-8888, RGB24-888 (packed), where x means that the corresponding bits in the container are not used
 - Premultiplied ARGB and RGBA formats
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs] or adding 0s)
 - Support for antiflicker on RGB pixel formats using 3-tap filter

- Three Video pipelines (VID1, VID2, and VID3):
 - Pixel formats: ARGB16-4444, xRGB12-4444, RGBx12-4444, RGBA12-3333, RGBA16-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, RGB24-888, BGRA32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21 (where x means that the corresponding bits in the container are not used)
 - Premultiplied ARGB and RGBA formats
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
 - Maximum input width of 1920 pixels
 - No limitation on the input height
 - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
 - Alpha blending factor is rescaled like the R, G, and B color components.
 - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB32-8888. Images in YUV4:2:2 format with 90- or 270-degree rotation are preprocessed to YUV4:4:4 before the scaler, by duplicating the missing Chroma.
 - Programmable VC-1 range mapping
- One write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
 - Programmable color space conversion RGB24 into YUV4:4:4 or to YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21 using programmable poly-phase filter
 - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
 - Selection of the color depth reduction from RGB24 to RGB16
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
 - Maximum input width of 1920 pixels
 - No limitation on the input height
 - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
 - Alpha blending factor is rescaled like the R, G, and B color components.
 - Selection of the source of the data:
 - Overlay output:
 - Primary LCD output
 - Secondary LCD output
 - Third LCD output
 - TV output
 - Pipelines:
 - Graphic
 - Video 1
 - Video 2
 - Video 3

- Three LCD outputs: primary (LCD1), secondary (LCD2), and tertiary (LCD3):
 - Input pixel format: ARGB32-8888
 - Output pixel format: RGB24-888 and YUV4:2:2 (YUV4:2:2 only available when BT mode output is enabled)
 - Overlay of graphic and video for one to four pipelines
 - Source and destination transparency color key
 - Global and pixel alpha blending (up to 8-bit blending factor)
 - Z-order programmable (full flexibility)
 - Displays supported:
 - Active matrix color: 12-, 16-, 18-, and 24-bit panel interface support (replicated or dithered encoded pixel values)
 - Independent programmable timing generators for LCD1, LCD2, and LCD3 to support:

Using DPI1 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI2 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI3 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

- Configurable LCD output mode: progressive or interlace mode
- Multiple-cycle output format on 8-, 9-, 12-, and 16-bit interface time division multiplexing (TDM)
- One TV output:
 - Input pixel format: ARGB40-10.10.10.10
 - Output pixel format: ARGB40-10.10.10.10
 - Overlay of graphic and video for one to four pipelines
 - Source and destination transparency color key
 - Global and pixel alpha blending (up to 10-bit blending factor)
 - Z-order programmable (full flexibility)
 - Slave mode support (no master mode support) with synchronization signals provided by HDMI TX:
 - HSYNC (horizontal synchronization signal)
 - VSYNC (vertical synchronization signal)
 - RE (data request signal)
 - FID (field ID: even and odd field information)
 - RGB30-10.10.10 data bus output for connection to HDMI TX and extended to 36 by duplication of the MSBs
 - HD-1080p, HD-1080i, HD-720p, SD-480p, SD-576p, SD-576i, and SD-480i using HDMI
 - HDMI deep color mode support, 30-bit data output to HDMI encoder
 - Pixel duplication capability (from one pixel clock cycle up to eight cycles)
- Panel support with MIPI DPI protocol:
 - 12-, 16-, 18-, and 24-bit active matrix panel interface support (replicated or dithered encoded pixel values)
- Common:
 - Rotation 0, 90, 180, and 270 degrees using DMM-TILER
 - Synchronized buffer update
 - Hardware cursor (using the graphics pipeline or one of the video pipelines)

- Independent gamma curve support on LCDs outputs and TV output
- Multiple-buffer support
- Mirroring/flip-flop support (using DMM-TILER)
- Programmable color phase rotation (CPR)
- Alpha blending support:
 - Embedded pixel factor (ARGB and RGBA)
 - Global alpha
- DMA (internal to the DISPC):
 - Support for accessing tiled structure through the TILER inside the dynamic memory management (DMM)
 - Support for accessing nontiled structure through the TILER or directly
 - Support for rotation, flip-flop, and mirroring through the TILER inside the DMM
 - Support for memory fragmentation through the TILER inside the DMM
 - Integrated shared buffers between DMA engine and pipelines
 - Programmable buffer thresholds
 - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
 - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
 - DMA buffer hand-check in stall mode
 - Arbitration between high and low priority (GFX, VID1, VID2, VID3, and WB pipelines)
- Power modes:
 - Low-power saving modes
 - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
 - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
 - All buffers associated to a single pipeline
 - Reallocation of the buffers of the nonactive pipelines to the active pipelines

11.2.2 DISPC Environment

The DISPC provides the required control signals to interface directly to an external parallel panel for the MIPI DPI protocol.

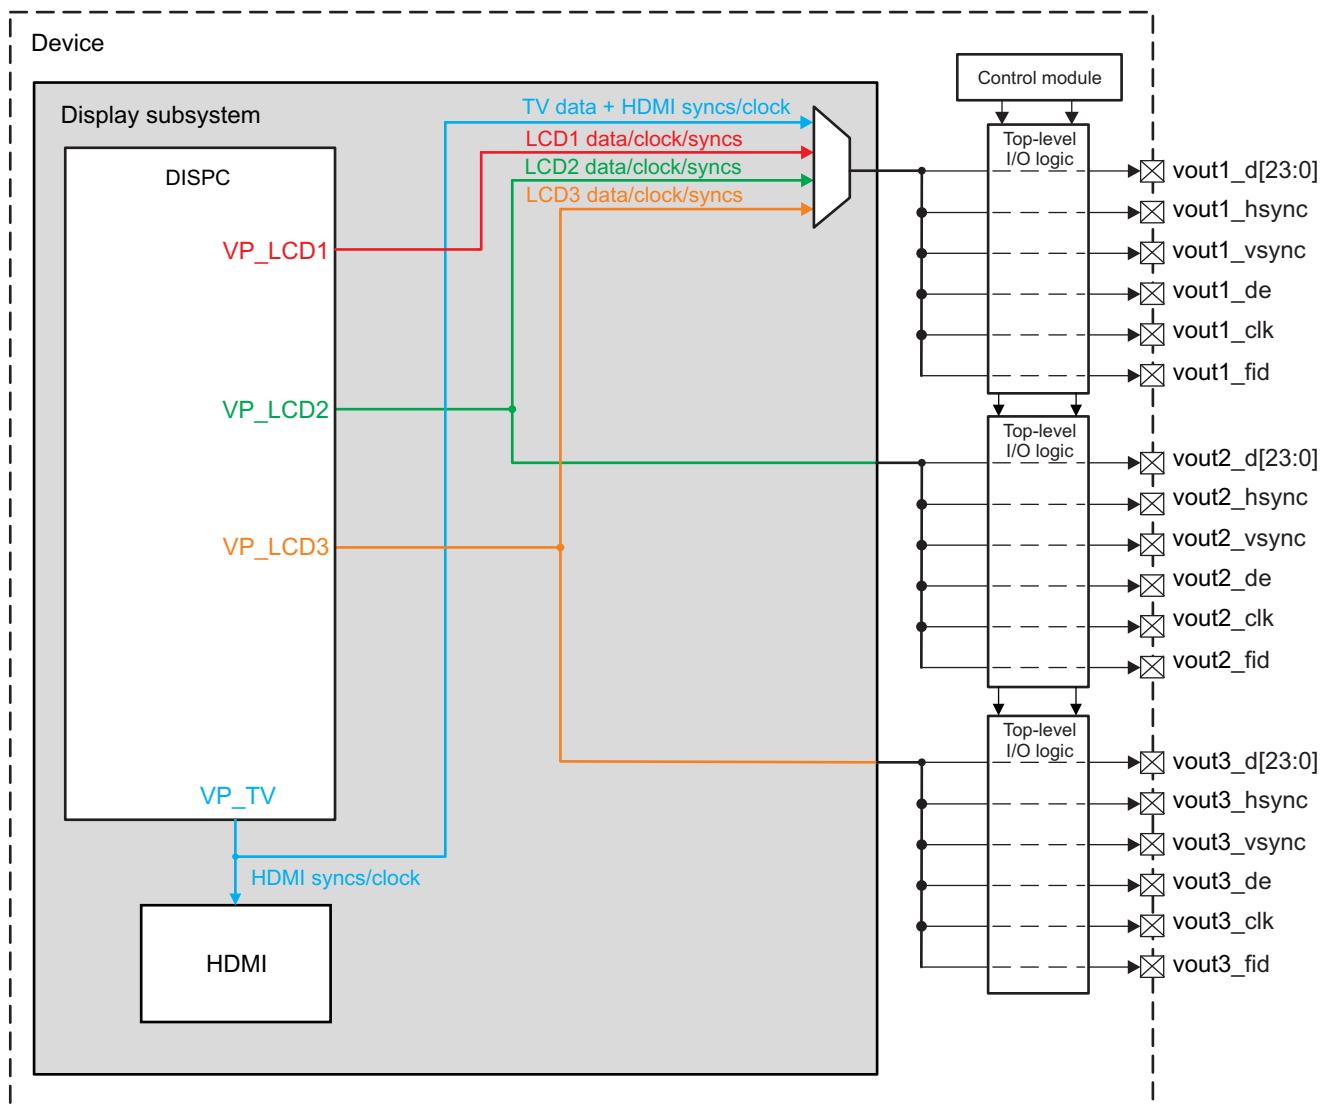

Figure 11-23 shows the LCD support parallel interface.

NOTE: Parallel interface is available through the LCD1, LCD2, LCD3, and TV outputs of the DISPC.

The LCD data and control signals are multiplexed with the TV output data, and control signals are provided by the HDMI module.

The selection can be done at the top level of the display subsystem. For further details and signal mapping, see Section 11.1.1, *Display Subsystem Environment*.

Figure 11-23. DISPC LCD Support Parallel Interface

dispc-083

NOTE: The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see [Section 18.4.6.1.1](#), Pad Configuration Registers, in [Chapter 18 Control Module](#).

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

[Table 11-81](#) describes the interface signals to/from the LCD panel in bypass mode.

Table 11-81. DISPC Parallel Interface Signals

Signal Name ⁽¹⁾	Type ⁽²⁾	Description
voutX_d[23:0]	O	Pixel data
voutX_clk	O	Pixel clock
voutX_vsync	O	Vertical synchronization. The LCD frame clock (vsync) toggles after all the lines in a frame are transmitted to the LCD panel and a programmable number of line clock cycles has elapsed at the beginning and end of each frame.
voutX_hsync	O	Horizontal synchronization. The LCD line clock (hsync) toggles after all pixels in a line are transmitted to the LCD panel and a programmable number of pixel clock wait-states has elapsed at the beginning and end of each line.
voutX_de	O	In active matrix technology, the DE signal acts as an output-enable signal to indicate when data must be latched using the pixel clock.
voutX_fid	O	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.

⁽¹⁾ X = 1, 2, or 3, indicates the corresponding parallel video output (VOUT1, VOUT2, or VOUT3)

⁽²⁾ I = Input, O = Output, I/O = Input/Output

11.2.2.1 DISPC LCD Output and Data Format for the Parallel Interface

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

[Figure 11-24](#) through [Figure 11-27](#) show the pixel data bus, depending on the use of 12-, 16-, 18-, or 24-pixel data output pins.

In the Active matrix display type, one pixel per pixel clock is displayed.

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.

[Figure 11-24](#) through [Figure 11-27](#) show 12-, 16-, 18-, and 24-bit active matrix displays, respectively.

11.2.2.2 DISPC Transaction Timing Diagrams

Figure 11-28 through Figure 11-31 show timing diagrams of synchronization signals and pixel clocks for active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields listed in Table 11-83.

Table 11-83. DISPC Programmable Fields in Bypass Mode

Name	Register	Description
PPL	DISPC_SIZE_LCD0[11:0] PPL value + 1	Pixels per line
LPP	DISPC_SIZE_LCD0[27:16] LPP value + 1	Lines per panel
HBP	DISPC_TIMING_Ho[31:20] HBP value + 1	Horizontal back porch
HFP	DISPC_TIMING_Ho[19:8] HFP value + 1	Horizontal front porch
HSW	DISPC_TIMING_Ho[7:0] HSW value + 1	Horizontal synchronization pulse width
VBP	DISPC_TIMING_Vo[31:20] VBP value	Vertical back porch
VFP	DISPC_TIMING_Vo[19:8] VFP value	Vertical front porch
VSW	DISPC_TIMING_Vo[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF ⁽¹⁾	DISPC_POL_FREQo[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF ⁽²⁾	DISPC_POL_FREQo[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_POL_FREQo[15] IEO	Invert DISPC_ACBIAS
IPC ⁽³⁾	DISPC_POL_FREQo[14] IPC	Invert DISPC_PCLK
IHS	DISPC_POL_FREQo[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_POL_FREQo[12] IVS	Invert DISPC_VSYNC

⁽¹⁾ DISPC_POL_FREQo[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF must match (x = 0,1,2).

⁽²⁾ DISPC_POL_FREQo[16] RF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_RF must match (x = 0,1,2).

⁽³⁾ DISPC_POL_FREQo[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC must match (x = 0,1,2).

- Active matrix timing configuration 1:
 - DISPC_POL_FREQo[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF = 0
 - DISPC_POL_FREQo[16] RF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_RF = 0
The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
 - DISPC_POL_FREQo[15] IEO = 0
The DE signal is active high.
 - DISPC_POL_FREQo[14] IPC = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC = 0
The pixel data are driven on the rising edge of PCLK.
 - DISPC_POL_FREQo[13] IHS = 0
The HSYNC signal is active high.
 - DISPC_POL_FREQo[12] IVS = 0
The VSYNC signal is active high.

Figure 11-28. DISPC Active Matrix Timing Diagram of Configuration 1 (Start of Frame)

Figure 11-29. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Lines)

Figure 11-30. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Frames)

Figure 11-31. DISPC Active Matrix Timing Diagram of Configuration 1 (End of Frame)

- Active matrix timing configuration 2:
 - DISPC_POL_FREQo[17] ONOFF = 1 and CTRL_CORE_SMA_SW_1[DSS_CHx_ON_OFF] = 1
 - DISPC_POL_FREQo[16] RF = 1 and CTRL_CORE_SMA_SW_1[DSS_CHx_RF] = 1
The HSYNC and VSYNC signals are driven on the rising edge of PCLK.
 - DISPC_POL_FREQo[15] IEO = 1
The DE signal is active low.
 - DISPC_POL_FREQo[14] IPC = 1 and CTRL_CORE_SMA_SW_1[DSS_CHx_IPC] = 1
The pixel data is driven on the falling edge of PCLK.
 - DISPC_POL_FREQo[13] IHS = 1
The HSYNC signal is active low.
 - DISPC_POL_FREQo[12] IVS = 1

The VSYNC signal is active low.

Figure 11-32. DISPC Active Matrix Timing Diagram of Configuration 2 (Start of Frame)

Figure 11-33. DISPC Active Matrix Timing Diagram of Configuration 2 (Between Lines)

Figure 11-34. DISPC Active Matrix Timing Diagram of Configuration 2 (Between Frames)

11.2.2.3 DISPC TV Output and Data Format for the Parallel Interface

This section describes the TV output pixel data bus for the parallel interface.

The TV pixel data interface is a 30-bit RGB interface. Only the MSB part of each color component is connected to the display subsystem boundary: R[9:2], G[9:2], B[9:2]. The output of the data is synchronized to the data request signal (HDMI_M_DE) from the HDMI encoder.

Figure 11-40 shows the format of the TV output pixel data.

Figure 11-40. DISPC TV Output Pixel Data

dispc-093

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.2.3 DISPC Integration

This section describes the DISPC integration in the device (see Figure 11-41). For complete details about clocks and resets, see Section 11.1, *Display Subsystem Overview*.

Figure 11-41. DISPC Integration

Table 11-84 and Table 11-85 list the integration attributes and clock and resets, respectively.

Table 11-84. DISPC Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	L3_MAIN for data transfer and configuration

Table 11-85. DISPC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	F_CLK	DSS_CLK DPLL_DSI1_A_CLK1 DPLL_DSI1_B_CLK1 DPLL_DSI1_C_CLK1 DPLL_HDMI_CLK1	PRCM DPLL_VIDEO1 DPLL_HDMI	Functional clock for the DISPC logic. For the multiplexing description, see Section 11.1.2.1, Display Subsystem Clocks .
	LCD1_CLK	DSS_CLK DPLL_DSI1_A_CLK1	DPLL_VIDEO1 DPLL_HDMI	Clock used to generate the divided pixel clock for the primary LCD interface. For the multiplexing description, see Section 11.1.2.1, Display Subsystem Clocks .
	LCD2_CLK	DSS_CLK DPLL_DSI1_B_CLK1	PRCM DPLL_VIDEO1 DPLL_HDMI	Clock used to generate the divided pixel clock for the secondary LCD interface. For the multiplexing description, see Section 11.1.2.1, Display Subsystem Clocks .
	LCD3_CLK	DSS_CLK DPLL_DSI1_C_CLK1	DPLL_VIDEO1 DPLL_HDMI	Clock used to generate the divided pixel clock for the third LCD interface. For the multiplexing description, see Section 11.1.2.1, Display Subsystem Clocks .
	DISPC_TV_FCLK	F_CLK DPLL_HDMI_CLK1	DSS DPLL_HDMI	TV functional clock (this is either the F_CLK or a clock driven from the DPLL_HDMI). For the multiplexing description, see Section 11.1.2.1, Display Subsystem Clocks .
	DISPC_TV_CLK	DSS_HDMI_PCLK	HDMI	Pixel clock provided by the HDMI module. For the multiplexing description, see Section 11.1.2.1, Display Subsystem Clocks .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_RST	DSS_RST	PRCM	Hardware reset is coming from the PRCM module or through a software reset performed at the DSS level. For the tree reset description, see Section 11.1.2, Display Subsystem Integration . NOTE: The DSS_RST signal is provided to the entire display subsystem. When inside the display subsystem boundaries, it is named DISPSS_RST, which on its end is provided to the DISPC and is named DISPC_RST.

Table 11-86. DISPC Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.
DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5 DMA_SYSTEM_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the device DMA is generated by the DISPC IP.

NOTE: The “Default Mapping” column in [Table 11-86 DISPC Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.

For more information about the IRQ_CROSSBAR module, see [Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#).

For more information about the DMA_CROSSBAR module, see [Section 18.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#).

For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

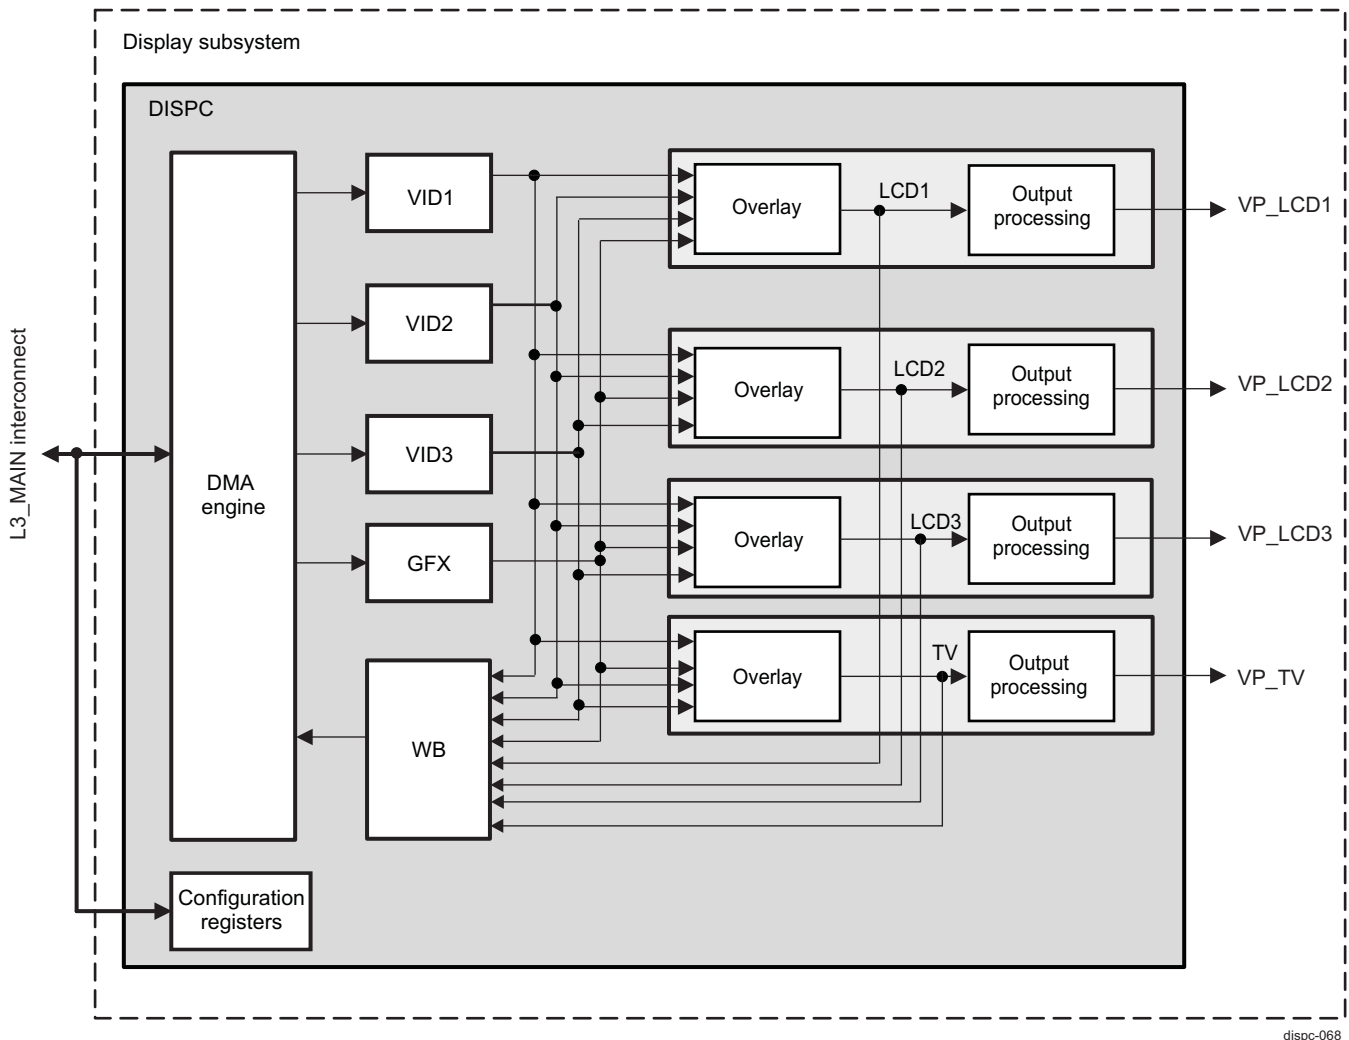

For more information about the device DMA_SYSTEM module, see [Section 16.1, System DMA](#).

For more information about the device EDMA module, see [Section 16.2, Enhanced DMA](#).

11.2.4 DISPC Functional Description

The DISPC can read and display the encoded pixel data stored in memory (see [Figure 11-42](#)).

Figure 11-42. DISPC Architecture Overview

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (replication, antiflicker) and video pipelines (VC-1, color space conversion, scaling, overlay, transparency, and so forth).

The data coming out of a pipeline is sent to one of the four outputs, depending on the user configuration. An overlay manager manages inputs of multiple pipelines. User timing configurations for LCD and TV are available.

The DISPC allows the capturing of one output of the pipeline or overlay manager to redirect it into the WB pipeline. It allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing, and so forth to perform memory-to-memory transfer with data processing.

11.2.4.1 DISPC Clock Configuration

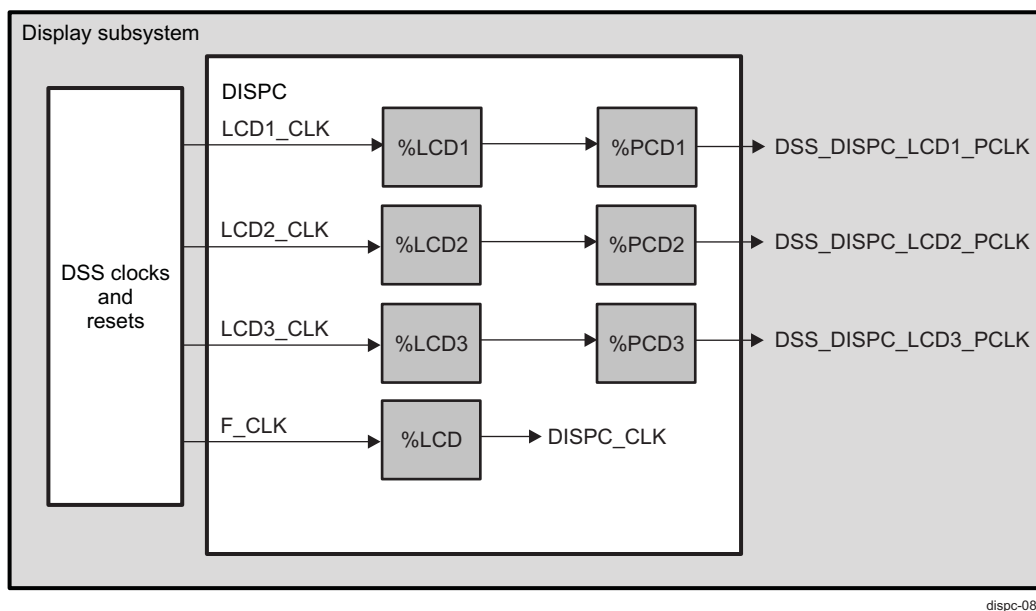

The PCLK frequency for each LCD output is derived from a dedicated input clock: LCD1_CLK, LCD2_CLK, or LCD3_CLK for the three LCD outputs, respectively. Each input clock is divided by the values of the DISPC_DIVISORo[23:16] LCD bit field and then the DISPC_DIVISORo[7:0] PCD bit field independently for each LCD pixel clock (see Figure 11-43). DSS_DISPC_LCD1_PCLK, DSS_DISPC_LCD2_PCLK, and DSS_DISPC_LCD3_PCLK are independent:

- $DSS_DISPC_LCD1_PCLK = (LCD1_CLK / LCD1) / PCD1$
- $DSS_DISPC_LCD2_PCLK = (LCD2_CLK / LCD2) / PCD2$
- $DSS_DISPC_LCD3_PCLK = (LCD3_CLK / LCD3) / PCD3$

The functional clock of the DISPC is derived from F_CLK by an independent divisor. The dividing value is set in the DISPC_DIVISORo[23:16] LCD bit field.

For backward compatibility, the divisor value LCD can be set to the value of LCD1. To enable this functionality, the DISPC_DIVISOR[0] ENABLE bit must be set to 1.

Figure 11-43. DISPC Clock Tree Overview

dispc-088

11.2.4.2 DISPC Software Reset

To perform a software reset on the DISPC, set the DISPC_SYSCONFIG[1] SOFTRESET bit to 0x1. The DISPC_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the DISPC_SYSCONFIG[1] SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before performing DISPC operations.

11.2.4.3 DISPC Power Management

The DISPC supports the MStandby/Wait, IdleReq/SIdleAck, and wake-up protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

11.2.4.3.1 DISPC Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the `DISPC_SYSCONFIG[4:3]` SIDLEMODE bit field.

Condition of assertion of the SIdleAck signal:

- In no-idle mode: SIdleAck is never asserted.
- In force-idle mode: SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to an IdleReq assertion.

NOTE: The proper use of force-idle mode assumes that no interrupt needs to be generated.

- In smart-idle mode: SIdleAck is asserted when at least the following conditions are satisfied:
 - No interrupt is pending.
 - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted, the DISPC interface lock used by the slave port can be shut down at any time.

The conditions of deassertion of the SIdleAck signal are:

- In force-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.
- In smart-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

11.2.4.3.2 DISPC StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the `DISPC_SYSCONFIG[13:12]` MIDLEMODE bit field. The functional clock is always active if the module is enabled. The L3_MAIN clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode: MStandby is never asserted.
- In force-standby mode: MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
 - The GFX pipeline is disabled or enabled and the data fetch is complete for the GFX window, or the GFX pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The VID1 pipeline is disabled or enabled and the data fetch is complete for the VID1 window, or the VID1 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The VID2 pipeline is disabled or enabled and the data fetch is complete for the VID2 window, or the VID2 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The VID3 pipeline is disabled or enabled and the data fetch is complete for the VID3 window, or the VID3 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The WB pipeline is disabled or enabled and the data store to memory is complete for the WB picture, or the WB pipeline is enabled but the data storage did not complete and data in the DMA buffer is lower than the low threshold value.

The MStandby signal asserts whenever all five events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3_MAIN master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode: MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
 - The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
 - The VID1 pipeline is enabled but the data fetch did not complete for the VID1 window, and the data in the DMA buffer is less than the low threshold value.
 - The VID2 pipeline is enabled but the data fetch did not complete for the VID2 window, and the data in the DMA buffer is less than the low threshold value.
 - The VID3 pipeline is enabled but the data fetch did not complete for the VID3 window, and the data in the DMA buffer is less than the low threshold value.
 - The WB pipeline is enabled but the data store did not complete for the WB picture, and the data in the DMA buffer more than the high threshold value.

Detection of the deassertion conditions assumes that the interface clocks are active.

11.2.4.3.3 DISPC Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG\[2\]](#) ENAWAKEUP bit. Because the SWakeup signal is asynchronous, it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
- The VID1 pipeline is enabled but the data fetch did not complete for the VID1 window, and the data in the DMA buffer is less than the low threshold value.
- The VID2 pipeline is enabled but the data fetch did not complete for the VID2 window, and the data in the DMA buffer is less than the low threshold value.
- The VID3 pipeline is enabled but the data fetch did not complete for the VID3 window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled and the data in the DMA buffer is more than the high threshold value.
- The last pixel displayed into the LCD1 panel if it is not the last frame
- The last pixel displayed into the LCD2 panel if it is not the last frame
- The last pixel displayed into the LCD3 panel if it is not the last frame
- The last pixel displayed into the TV panel if it is not the last frame

The SWakeup signal is asserted whenever any one of these nine events occurs and IdleAck is asserted.

When one of the active pipelines reaches the low threshold and must refill its DMA buffer for the current frame, all other pipelines refill their own DMA buffer even if their low threshold has not been reached. The [DISPC_CONFIG1\[17\]](#) BUFFERFILLING bit is used to increase the probability that the time increases, where there is no access to the L3_MAIN interconnect.

The condition of deassertion of the SWakeup signal is:

- Immediately after deassertion of IdleReq

11.2.4.4 DISPC Interrupt Requests

The interrupt line, DISPC_DREQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC_IRQENABLE](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the **DISPC_IRQSTATUS** register must be accessed. This register regroups the status of internal events in the module that generate an interrupt (read 0: no interrupt occurred; read 1: interrupt occurred; write 1: status bit reset). For more information about checking and clearing interrupt events, see [Section 11.1.5, Display Subsystem Register Manual](#).

[Table 11-87](#) describes the interrupts generated for the DISPC.

Table 11-87. DISPC Interrupts

Interrupt Name	Description
FLIPIIMMEDIATEDONE_IRQ	Flip immediate done: Occurs when the DMA engine has acknowledged the immediate BA change, and software can write the new BA0.
FRAMEDONE1_IRQ	Frame done for LCD1 output: Active frame related to the LCD1 is complete and LCD1 output of the DISPC is disabled.
FRAMEDONE2_IRQ	Framedone for LCD2 output: Active frame related to the LCD2 is complete and LCD2 output of the DISPC is disabled.
FRAMEDONE3_IRQ	Frame done for LCD3 output: Active frame related to the LCD3 is complete and LCD3 output of the DISPC is disabled.
FRAMEDONETV_IRQ	Frame done for TV output: Active frame related to the TV output is complete and TV output of the DISPC is disabled.
FRAMEDONEWB_IRQ	Frame done for WB output: Active frame related to the WB is complete. First, it is used when the WB channel is connected to one of the pipelines to determine when the memory-to-memory transfer through DISPC is completed. Second, it is used when the WB channel is connected to one of the overlay output in nonreal-time mode to determine when the memory-to-memory transfer with overlay processing is completed.
VSYNC1_IRQ	VSYNC for primary LCD output: VSYNC interrupt for the primary LCD has occurred at the end of the frame.
VSYNC2_IRQ	VSYNC for secondary LCD output: VSYNC interrupt for the secondary LCD has occurred at the end of the frame.
VSYNC3_IRQ	VSYNC for third LCD output: VSYNC interrupt for the third LCD has occurred at the end of the frame.
EVSYNC_EVEN_IRQ	VSYNC for even field: EVSYNC_EVEN interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is even) (HDMI)
EVSYNC_ODD_IRQ	VSYNC for odd field: EVSYNC_ODD interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is odd) (HDMI)
ACBIASCOUNTSTATUS1_IRQ	AC bias count status for LCD1 output: AC bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS2_IRQ	AC bias count status for LCD2 output: AC bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS3_IRQ	AC bias count status for LCD3 output: AC bias transition counter has decremented to 0.
PROGRAMMEDLINENUMBER_IRQ	Programmed line number: The primary LCD has reached the user programmed line number.
VID1ENDWINDOW_IRQ	End of the VID1 window: The DMA engine has fetched all the data from memory for the VID1 for the current frame.
VID2ENDWINDOW_IRQ	End of the VID2 window: The DMA engine has fetched all the data from memory for the VID2 for the current frame.
VID3ENDWINDOW_IRQ	End of the VID3 window: The DMA engine has fetched all the data from memory for the VID3 for the current frame.
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.
VID1BUFFERUNDERFLOW_IRQ	VID1 DMA buffer underflow: The input VID1 DMA buffer goes underflow.
VID2BUFFERUNDERFLOW_IRQ	VID2 DMA buffer underflow: The input VID2 DMA buffer goes underflow.

Table 11-87. DISPC Interrupts (continued)

Interrupt Name	Description
VID3BUFFERUNDERFLOW_IRQ	VID3 DMA buffer underflow: The input VID3 DMA buffer goes underflow.
WBBUFFEROVERFLOW_IRQ	WB DMA buffer overflow: The output WB DMA buffer goes overflow. It cannot occur when WB channel is used in memory-to-memory transfer mode but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory-to-memory mode, there is timing constraint.
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input graphics DMA buffer goes underflow.
PALETTEGAMMALOADING_IRQ	Gamma table loading: Gamma table in the graphics pipeline has been loaded using the DISPC DMA engine.
WBUNCOMPLETEERROR_IRQ	The write-back buffer has been flushed before being fully drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that, and will trigger every frame.
OCPERROR_IRQ	OCP error: L3_MAIN interconnect has sent SResp = ERR
SYNCLOST1_IRQ	Synchronization lost on LCD1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST2_IRQ	Synchronization lost on LCD2 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST3_IRQ	Synchronization lost on LCD3 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOSTTV_IRQ	Synchronization lost on TV output: Occurs when porches are not wide enough to load the pipelines with data (TV output connected to the HDMI).
WAKEUP_IRQ	Wakeup: Occurs when the SWakeUp signal is asserted.

11.2.4.5 DISPC DMA Requests

The DMA synchronization line, DISPC_DREQ, is connected to the device DMA controllers (see [Table 11-86, DMA Requests](#)). This DMA request is not a classical one, but rather a synchronization signal between the DISPC and device DMA. The device DMA is informed that a programmable number of lines are output to the LCD and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in [Table 11-87](#). This allows the device DMA channel to be synchronized with the internal DMA controller in the display subsystem.

In other words, it allows synchronizing a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DISPC_DREQ request is generated at a programmable line number defined in the `DISPC_LINE_NUMBER[11:0] LINENUMBER` bit field. This process allows an application to use a single frame buffer and to update it after a certain number of lines are read by the DISPC.

11.2.4.6 DISPC DMA Engine

The DMA engine:

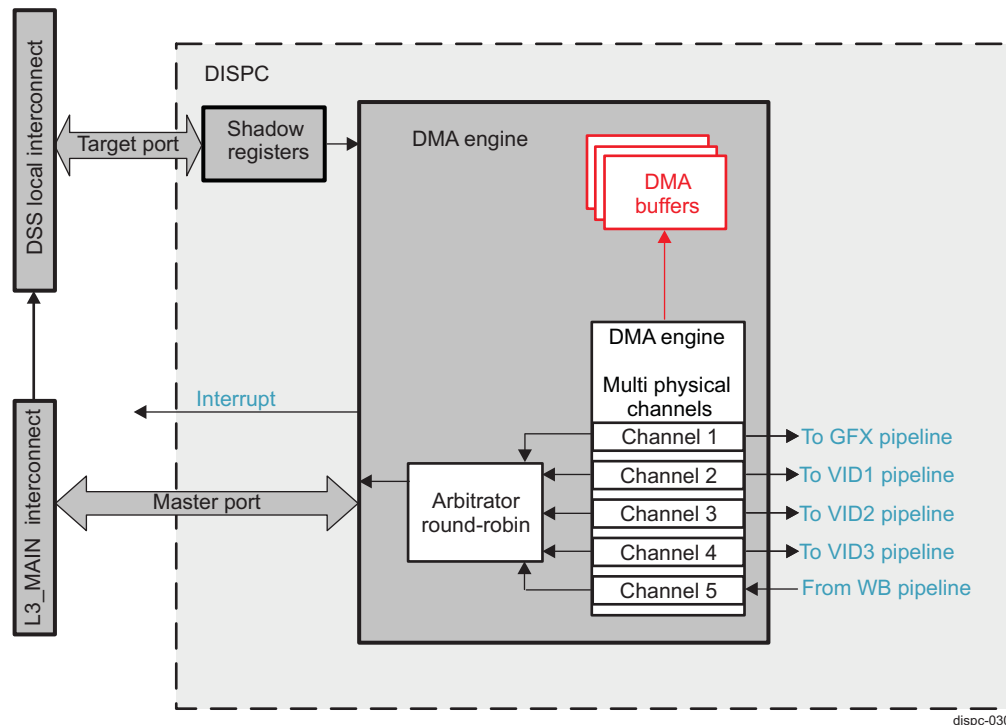

- Supplies data (encoded pixel data and gamma curve) from memories to the GFX, VID1, VID2, and VID3 pipelines through the interconnect based on the configuration of the DISPC and pipeline setting.
- Stores encoded pixel data from GFX/VID pipelines or overlays to memories through the WB pipeline and interconnect based on the configuration of the DISPC and WB pipeline setting.

Each pipeline has a dedicated buffer and a channel with independent settings. Table 11-88 lists the default size and allocation of the DMA buffer. Each DMA buffer is divided into two spaces, top and bottom. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of available spaces. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and system latency. The space assignments are done in the `DISPC_GLOBAL_BUFFER` register.

Table 11-88. DISPC DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	2 lines \times 640 \times 128 bits
VID1	2 lines \times 1024 \times 128 bits
VID2	2 lines \times 1024 \times 128 bits
VID3	2 lines \times 1024 \times 128 bits
WB	2 lines \times 1024 \times 128 bits

Figure 11-44 is an overview of the DMA engine.

Figure 11-44. DISPC DMA Engine Overview

11.2.4.6.1 DISPC Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address
- Aligns the address
- Defines the burst structure:
 - Type of burst (1D- or 2D-burst structure)
 - Length of the burst

The DMA engine generates scan addresses to read and write data to and from system memory. The base address defines the start address of the first pixel, and then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 or YUV4:2:0–NV21 format) defined by:
 - DISPC_GFX_BA_0[31:0] BA bit field
 - DISPC_GFX_BA_1[31:0] BA bit field
 - DISPC_VIDp_BA_0[31:0] BA bit field
 - DISPC_VIDp_BA_1[31:0] BA bit field
 - DISPC_VIDp_BA_UV_0[31:0] BA bit field
 - DISPC_VIDp_BA_UV_1[31:0] BA bit field
- bpp corresponds to the number of bits per pixel defined by the [DISPC_GFX_ATTRIBUTES\[4:1\] FORMAT](#) bit field or the [DISPC_VIDp_ATTRIBUTES\[4:1\] FORMAT](#) bit field.
- width corresponds to the number of pixels per line defined by the [DISPC_GFX_SIZE\[10:0\] SIZEX + 1](#) bit field or [DISPC_VIDp_SIZE\[10:0\] SIZEX + 1](#) bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by the [DISPC_GFX_ROW_INC\[31:0\] ROWINC – 1](#) bit field or the [DISPC_VIDp_ROW_INC\[31:0\] ROWINC – 1](#) bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV format, the pixel values are defined in two buffers (Y and UV). The base address of the Y buffers is defined in the [DISPC_VIDp_BA_j\[31:0\]](#) BA bit field. The base address of the UV buffers is defined in the [DISPC_VIDp_BA_UV_j\[31:0\]](#) BA bit field.

Table 11-89 summarizes the register settings for a simple access of a picture in the system memory.

Table 11-89. DISPC Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VIDp_BA_UV_j/DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC ⁽¹⁾	1 or other in row incremental value

⁽¹⁾ The [DISPC_WB_ROW_INC](#) register can be used only in 2D mode (using the Tiler). In order to use the [DISPC_WB_ROW_INC](#) register, the [DISPC_WB_ATTRIBUTES\[8\] BURSTTYPE](#) bit must be set to 1.

An interconnect request (128 bits) corresponds to one or several pixels, depending on the bits per pixel. Therefore, the DMA engine determines the appropriate burst sequence to optimize the fetching/storing of each new line. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports bursts of 2 × 128 bits, 4 × 128 bits, and 8 × 128 bits. The default burst size at reset time is 8 × 128 bits. The maximum burst size can be configured for each pipeline by setting the [DISPC_GFX_ATTRIBUTES\[7:6\] BURSTSIZE](#) or [DISPC_VIDp_ATTRIBUTES\[15:14\] BURSTSIZE](#) bit field. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue one request and/or smaller burst requests. Two types of burst are present which can be configured from the [DISPC_GFX_ATTRIBUTES\[29\] BURSTTYPE](#) or [DISPC_VIDp_ATTRIBUTES\[29\] BURSTTYPE](#) bit. Also, a force function is present configured from the [DISPC_GFX_ATTRIBUTES\[16\] FORCE1DTILEDMODE](#) or [DISPC_VIDp_ATTRIBUTES\[20\] FORCE1DTILEDMODE](#) or [DISPC_WB_ATTRIBUTES\[20\] FORCE1DTILEDMODE](#) bit for the following burst types:

- 1-D burst is used if the fetch/storage is linear in memory through the TILER. There is no rotation of the

frame buffer. The frame buffer is not tiled.

- 2-D burst is used if the frame buffer is tiled.

Even if the DISPC_VIDp_ROW_INC register does not equal 1, the user can select 2-D burst. 2-D burst is used when the DISPC is configured to read one field of a frame by accessing only the even and odd lines.

NOTE: The burst size is initialized once at configuration and can be changed when the DISPC is disabled.

11.2.4.6.2 DISPC Immediate Base Address Flip Mechanism

The Flip Immediate mechanism is used to change of the fly the content of the frame buffer which is currently being displayed. The mechanism allows multiple changes (flips) of the base address (BA) during a frame. The mechanism is available for all pipelines (VID1, VID2, VID3, and GFX). Changes to the BA can be applied during the same line, or during different lines.

The following considerations must be considered:

- Data fetching from a new immediate BA is aligned with the data fetch mechanism of the DISPC DMA engine itself, and not with HSYNC or any other DISPC timing signal. After new VSYNC frame pulse, new BA is taken by hardware, as soon as the first set of lines is sent to internal pipeline of the DMA engine.
 - If multiple new BAs are written during the same line (before DMA engine acknowledges the first BA change), then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA takes only the last BA provided within the current line scan.
 - If multiple new BAs are written during different lines within the current frame, then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA takes the new BA each time it is updated.
- Immediate BA change cannot be achieved synchronously for two or more pipelines.
- Immediate BA change is possible only for BA0; it is not possible for BA1. Interlaced mode using BA0 and BA1 is not supported.
- Immediate BA change is supported only in RGB color space.

The Flip Immediate mechanism programming sequence follows:

1. Software writes the new immediate BA to the `DISPC_GFX_BA_j` register (where j=0) for the GFX pipeline, or to the `DISPC_VID1_BA_j` / `DISPC_VID2_BA_j` / `DISPC_VID3_BA_j` register (where j=0) for the required VID pipeline.
2. Software sets to 0x1 the corresponding EN bit for the required pipeline in the `DISPC_BA0_FLIPIMMEDIATE_EN` register.
3. The DISPC DMA engine, after completing its current line (or set of lines) fetch, takes the new immediate BA.
4. Hardware resets the EN bit in `DISPC_BA0_FLIPIMMEDIATE_EN` register and asserts a flip immediate IRQ. The IRQ can be enabled through the `DISPC_IRQENABLE[31]` FLIPIMMEDIATEDONE_EN bit. The status of the event is available in the `DISPC_IRQSTATUS[31]` FLIPIMMEDIATEDONE_IRQ bit.

11.2.4.6.3 DISPC DMA Buffers

11.2.4.6.3.1 DISPC READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line or the external VSYNC is received, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3_MAIN interconnect. Enabling or disabling the DISPC flushes the DMA buffers (except the WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3_MAIN interconnect.

- When low threshold (set in the `DISPC_GFX_BUF_THRESHOLD[15:0]` BUFLOWTHRESHOLD or

DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3_MAIN interconnect to fill the DMA buffer.

- When high threshold (set in the [DISPC_GFX_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD or [DISPC_VIDp_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the [DISPC_GFX_PRELOAD\[11:0\]](#) PRELOAD or [DISPC_VIDp_PRELOAD\[11:0\]](#) PRELOAD bit field, the [DISPC_GFX_ATTRIBUTES\[11\]](#) BUFPRELOAD bit, or the [DISPC_VIDp_ATTRIBUTES\[19\]](#) BUFPRELOAD bit must be set to 0x0.

NOTE: When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

11.2.4.6.3.2 DISPC WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the [DISPC_WB_ATTRIBUTES\[19\]](#) WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: One of the overlay outputs going to LCD or TV outputs is captured and at the same time the data are sent on the output. The WB timings are controlled by the LCD or TV timings. The output of a VID/GFX pipeline is not sent to the write back, when the WB pipeline is connected to an overlay used in capture mode.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipelines is captured to perform a memory-to-memory transfer, with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.).

In capture mode: The WB DMA buffers are flushed when the VFP period starts after the HFP following the last line, or when the external VSYNC is received, depending on which output (LCD/TV) the WB pipeline is capturing data, if the programmed value in [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to 0. If the programmed value in [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to N (1:255), the write buffers DMA are flushed N lines later. The DMA engine starts storing data to memory through the L3_MAIN-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

NOTE: If the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to 0, the WB is reinitialized at the end of the last line of a frame at the beginning of the VFP signal. To let the WB complete the data write to the external memory, the highest possible value compatible with the vertical blanking period must be set.

NOTE: In WB capture mode, if a new frame starts before the WB DMA buffers contents are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The [DISPC_IRQSTATUS\[26\]](#) WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and triggers every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the [DISPC_IRQENABLE\[26\]](#) WBUNCOMPLETEERROR_EN register bit.

Software can avoid this by delaying the flush of WB DMA buffers through proper programming of the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling or disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

- When high threshold (set in the [DISPC_WB_BUF_THRESHOLD](#)[31:16] BUFHIGHTHRESHOLD bit field) is reached, the DMA engine starts sending data on the L3_MAIN interconnect to empty buffer.
- When low threshold (set in the [DISPC_WB_BUF_THRESHOLD](#)[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, to completely drain the DMA buffer, some smaller bursts (even single requests) must be issued. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of IDLE cycles between requests can be activated and determined by:

- Setting the [DISPC_WB_ATTRIBUTES](#)[27] IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the [DISPC_WB_ATTRIBUTES](#)[31:28] IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the [DISPC_WB_ATTRIBUTES](#)[27] IDLESIZE bit to 0x1, which considers the size of the burst (the [DISPC_WB_ATTRIBUTES](#)[15:14] BURSTSIZE bit field) to determine the number of IDLE cycles.
 - If BURSTSIZE = 0x0, then the number of IDLE cycles equals IDLENUMBER (0 to 15).
 - If BURSTSIZE = 0x1, then the number of IDLE cycles equals IDLENUMBER × 4 (0 to 60).
 - If BURSTSIZE = 0x2, then the number of IDLE cycles equals IDLENUMBER × 8 (0 to 120).

11.2.4.6.4 DISPC MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of DISPC real-time traffic, when required, based on the fullness of the DISPC DMA read and write buffers.

The mechanism is implemented for all DMA buffers (GFX, VID1, VID2, VID3 and WB). Only high-priority pipelines can contribute to the MFLAG mechanism.

Programmable buffer thresholds (hysteresis) for each pipeline are used to indicate when the local MFLAG signal for each pipeline is generated. All local MFLAG signals are ORed to generate a single DSS MFLAG out band signal, which is provided to the L3 interconnect for granting OCP requests. The out band DSS MFLAG signal is asynchronous to any ongoing OCP transaction.

The threshold for each pipeline corresponds to the fullness of the associated DMA buffer, and is defined by two threshold parameters:

- HT_MFLAG: High threshold.
 - For read access from the GFX, VID1, VID2, and VID3 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the VID1 pipeline in the [DISPC_VID1_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the VID2 pipeline in the [DISPC_VID2_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the VID3 pipeline in the [DISPC_VID3_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
- LT_MFLAG: Low threshold.
 - For read access from the GFX, VID1, VID2, and VID3 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the

programmed value, the associated local MFLAG signal goes low (deasserted).

- This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX_MFLAG_THRESHOLD\[15:0\]](#) LT_MFLAG bit field
 - For the VID1 pipeline in the [DISPC_VID1_MFLAG_THRESHOLD\[15:0\]](#) LT_MFLAG bit field
 - For the VID2 pipeline in the [DISPC_VID2_MFLAG_THRESHOLD\[15:0\]](#) LT_MFLAG bit field
 - For the VID3 pipeline in the [DISPC_WB_MFLAG_THRESHOLD\[15:0\]](#) LT_MFLAG bit field
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD \[15:0\]](#) LT_MFLAG bit field

By default, the MFLAG mechanism is disabled ([DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field = 0x0), and the DSS MFLAG out band signal is low (deasserted). The arbitration scheme for the DISPC pipelines is the same as described in [Section 11.2.4.6.7, DISPC Arbitration](#). That is, round-robin either between high-priority pipelines, or between normal-priority pipelines (if all pipelines are of normal priority).

When the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field is set to 0x2, the MFLAG mechanism is enabled, and the DSS MFLAG out band signal is dynamically set to 0 or 1, depending on DMA buffers fullness and programmed threshold levels, as explained previously in this section. In this case, the arbitration scheme for DISPC pipelines is round-robin between those high-priority pipelines, which have asserted local MFLAG signals. If there are no high-priority pipelines with asserted local MFLAG signals, then the arbitration scheme is the same as described in [Section 11.2.4.6.7, DISPC Arbitration](#).

The [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[2\]](#) MFLAG_START bit defines additional rules for the MFLAG mechanism:

- If the MFLAG_START bit is set to 0x0 (default value), then in the beginning of the frame when the DMA buffer is empty, the local MFLAG signal of each pipeline is kept at 0 until PRELOAD is reached (for more information on preloading, see [Section 11.2.4.6.3.1, DISPC READ DMA Buffers \(GFX and VID Pipelines\)](#)). Then, based on the setting of the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field, the MFLAG signal is generated and internal logic is arbitrating between pipeline requests.
- If the MFLAG_START bit is set to 0x1, then even in the beginning of the frame when the DMA buffer is empty, the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field defines the generation of the MFLAG signal for each pipeline.

11.2.4.6.5 DISPC Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture stored in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1-D or 2-D burst, depending on the setting. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the [DISPC_GFX_ROW_INC\[31:0\]](#) ROWINC or [DISPC_VIDp_ROW_INC\[31:0\]](#) ROWINC bit field.

NOTE: When 2-D burst mode is used, the access to data in memory is performed through the TILER module of DMM (for more details, see [Section 15.1.2, TILER Overview](#), in [Section 15.1, Memory Subsystem](#)), and as a result a maximum of one line can be skipped.

- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 of 2 pixel data containers, up to 1 of 16 pixel data containers, by setting the [DISPC_GFX_PIXEL_INC\[7:0\]](#) PIXELINC or [DISPC_VIDp_PIXEL_INC\[7:0\]](#) PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

NOTE: The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
 - One Y pixel data container = 8 bits = 1 pixel
 - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels, and the Chrominance component of 1 pixel (see Figure 11-45). Therefore, for the valid values of the PIXELINC bit field in the case of the following YUV4:2:2 format, caution must be taken because n equals the number of pixel data containers to skip, not the number of pixels:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

Figure 11-45. YUV4:2:2 Predecimation

dispc-094

11.2.4.6.6 DISPC Progressive-to-Interlaced Format Conversion

The DMA engine can be used to perform YUV4:2:0 NV12 and YUV4:2:0 NV21 progressive-to-interlaced data conversion with 0-degree orientation. Such conversion performed in the DSS consists of separating each progressive frame into two fields containing odd and even lines. This section provides generic approach details.

Two possible configurations are available, depending on the setting of the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit, which defines the stride of each pixel value buffer for the YUV format. The following must be considered for both configurations:

- The DISPC_VIDn_BA_j[31:29] BA and DISPC_VIDn_BA_UV_j[31:29] BA bit fields, and the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x0 to indicate 0-degree orientation.
- The DISPC_VIDn_BA_j[31:29] BA and DISPC_VIDn_BA_UV_j[31:29] BA bit fields must be set to 0x3, and the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x2 to indicate 180-degree orientation.

Configuration 1 – YUV4:2:0 progressive to interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x1. The CbCr container is twice the size of the Y container. All Luma and Chroma lines for even and odd fields are fetched from memory. The scaler unit of the respective pipeline can be used to downscale by 2 (through filtering) the fetched data to create the interlaced output. For more information about the scaler configuration, see [Section 11.2.4.10.4, Scaler Unit](#).

Configuration 2 – YUV4:2:0 progressive to YUV4:2:2 interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x0. The CbCr container is the same size as the Y container. The DISPC_VIDn_ROW_INC register for the respective pipeline must be configured so that only the Y data is vertically predecimated by 2 (for more information, see [Section 11.2.4.6.5, Predecimation](#)). The CbCr data must not be predecimated. As a result, only the even Luma lines for the even field and the odd Luma lines for the odd field are fetched from memory. To create the interlaced output, all the Chroma lines are fetched from memory.

11.2.4.6.7 DISPC Arbitration

The requests (reads or writes) sent to the L3_MAIN interconnect are pipelined and arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the following bits:

- DISPC_GFX_ATTRIBUTES[14] ARBITRATION
- DISPC_VIDp_ATTRIBUTES[14] ARBITRATION
- DISPC_WB_ATTRIBUTES[14] ARBITRATION

By default, all pipelines have the same priority (normal), which means all pipeline requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3_MAIN interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the LCD output in stall mode must have lower priority than pipelines associated with TV output.

11.2.4.6.8 DISPC DMA Power Modes

11.2.4.6.8.1 DISPC DMA Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other DMA buffers. The total number of DMA buffers for each pipeline is from 0 (pipeline inactive) to the number of pipelines × 2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of DMA buffers allocated for each pipeline must not be greater than the maximum available. The correct number of DMA buffers must be allocated to ensure no underflow. The number of DMA buffers allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

NOTE: When the number of buffers is changed, the thresholds must be reprogrammed to reflect the new configuration of the DMA buffer.

11.2.4.6.8.2 DISPC DMA Ultralow-Power Mode

In low-power mode, the L3_MAIN interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3_MAIN interconnect is not used to fetch new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3_MAIN interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see [Section 11.2.4.6.8.1, Low-Power Mode](#)).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the `DISPC_SYSCONFIG[13:12] MIDDLEMODE` bit field is set to 0x2 (smart-standby mode).

Two ultralow-power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the `DISPC_GFX_ATTRIBUTES[15] SELFREFRESH` or `DISPC_VIDp_ATTRIBUTES[15] SELFREFRESH` bit to 0x1 after capturing a frame in the DMA buffers. Self-refresh mode is stopped by setting the SELFREFRESH bit to 0x0.
- Automatic self-refresh mode: By setting the `DISPC_GFX_ATTRIBUTES[17] SELFREFRESHAUTO` or `DISPC_VIDp_ATTRIBUTES[17] SELFREFRESHAUTO` bit to 0x1, the transition from off to on self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

NOTE: The WB pipeline does not support ultralow-power mode.

11.2.4.7 DISPC Rotation and Mirroring

The DISPC provides flexible mechanisms for efficient implementation of rotation using the DISPC, its DMA engine, and the rotation engine of the TILER. The rotation is handled only through the TILER, which supplies the encoded pixels to the DISPC.

NOTE: No rotation or mirroring is supported when accessing the SDRAM directly.

The TILER supports:

- Rotation: 0-, 90-, 180-, and 270-degree views
- Mirroring
- Any combination of rotation and mirroring (for example, Rot-90 + mirroring)

Figure 11-46. DISPC 90-Degree Rotation With Mirroring

When accessing YUV4:2:2 data, each 32-bit value loaded into the DMA buffer can represent either:

- Two consecutive pixels on the same line (for instance, 0- to 180-degree rotation)
- Two pixels adjacent vertically (for instance, 90- to 270-degree rotation)

The reading from the DMA buffer supports the extraction of the two pixels, regardless of the rotation. When the pixels are not consecutive on the same line (90- to 270-degree rotation), the chrominance sample of the first pixel of each 32-bit value is duplicated for the second pixel in the same 32-bit value.

The rotation flag DISPC_VIDn_ATTRIBUTES[13:12] ROTATION and DISPC_VIDn_ATTRIBUTES[4:1] FORMAT bit fields define the processing to extract the pixels from YUV4:2:2 32-bit values. Software must ensure that the settings of the ROTATION and FORMAT bit fields are coherent with the rotation and mirroring defined through the address format in the TILER-specific address map. For more information, see [Section 15.2, Dynamic Memory Manager](#), in [Section 15.1, Memory Subsystem](#).

NOTE: For YUV4:2:0 NV12, 2D tiled memory access cases, the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field should be set properly to match with the intended rotation of the use case.

[Table 11-90](#) describes the register settings of the DISPC when accessing, rotating, and mirroring an image using the TILER. A physical base address (PBA) for each rotation is determined and set as the buffer address (BA). The row incremental is determined and set in ROW_INC. The value of the pixel increment, PIXEL_INC, is set to 0x1 (contiguous pixels).

Table 11-90. DISPC Register Settings for Rotation Using TILER

Rotation	Registers	Rotation With and Without Mirroring
0 degree	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	PBA0 1 to 16 ROW0
90 degrees	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/ DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/ DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	PBA90 1 to 16 ROW90
180 degrees	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/ DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	PBA180 1 to 16 ROW180
270 degrees	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/ DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	PBA270 1 to 16 ROW270

NOTE: For YUV format, in addition to the DISPC_VIDp_BA_j register used for the Y component, the DISPC_VIDp_BA_UV_j register must be set to define the base address of the UV frame buffer in memory.

The DISPC_WB_ROW_INC register can be used only in 2D mode (using the Tiler). In order to use the DISPC_WB_ROW_INC register, the DISPC_WB_ATTRIBUTES[8] BURSTTYPE bit must be set to 1.

The PBA rotation is determined by:

- PBA0 = PBA | (mode << 27) | (orientation << 29) | (1<<32)
- PBA90 = PBA | (mode << 27) | (orientation << 29) | (1<<32)
- PBA180 = PBA | (mode << 27) | (orientation << 29) | (1<<32)
- PBA270 = PBA | (mode << 27) | (orientation << 29) | (1<<32)

Where PBA is the physical base address of the image in the memory.

The ROW rotation is determined by:

- If 8 bits per pixel:
 - ROW0 = 16384: Width of the video picture in memory (in bytes) + 1

- ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
- ROW180 = 16384: Width of the video picture in memory (in bytes) + 1
- ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 16 bits per pixel:
 - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 32 bits per pixel:
 - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 16384: Width of the video picture in memory (in bytes) + 1

Table 11-91 and Table 11-92 list the DISPC rotation mode and rotation orientation definitions, respectively.

Table 11-91. DISPC Rotation Mode Definition

	8-Bit Tiled	16-Bit Tiled	32-Bit Tiled	Page Tiled
Mode	0	1	2	3

Table 11-92. DISPC Rotation Orientation Definition

Type of Orientation	Value
0-degree view	0x0
180-degree view with mirroring	0x1
0-degree view with mirroring	0x2
180-degree view	0x3
270-degree view with mirroring	0x4
270-degree view	0x5
90-degree view	0x6
90-degree view with mirroring	0x7

NOTE: For YUV4:2:0 progressive pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit must be set to 1 when rotating the picture by 0 and 180 degrees, and must be reset to 0 when rotating the picture by 90 and 270 degrees.

For YUV4:2:0 interlaced pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit must be set to 1 when rotating the picture by 0 and 180 degrees. Rotations of 90 and 270 degrees are not supported with this pixel format.

11.2.4.8 DISPC Memory Format

The graphic and video pipelines support various types of memory formats. Table 11-93 lists all supported formats for each pipeline.

Table 11-93. DISPC Memory Formats Supported

Formats	GFX	VID1	VID2	VID3	WB
xRGB12-4444	X	X	X	X	X
RGBx12-4444	X	X	X	X	X

11.2.4.9 DISPC Graphics Pipeline

The graphics pipeline input port is connected to the GFX FIFO, and to the four overlay managers or WB pipeline at its output. The pixel output is directed to an LCD, TV, or WB path by setting the [DISPC_GFX_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC_GFX_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 11-109](#) lists the bit field settings to orient a pipeline to an LCD, TV, or WB output. The default value directs the GFX pipeline to LCD1. The GFX pipeline can be enabled by setting the [DISPC_GFX_ATTRIBUTES\[0\]](#) ENABLE bit to 0x1.

- NOTE:** It is not possible to change the direction of the GFX pipeline on the fly. If the graphics pipeline must be connected to an overlay manager different from the one to which it is currently connected, then the following steps must be performed:
1. Disable the GFX pipeline by setting the `DISPC_GFX_ATTRIBUTES[0]` ENABLE bit to 0x0.
 2. Direct the GFX pipeline to the new overlay manager by modifying the `DISPC_GFX_ATTRIBUTES[8]` CHANNELOUT and `[31:30]` CHANNELOUT2 bits.
 3. Disable the DISPC output which corresponds with the overlay manager to which the GFX pipeline will be connected next. This is done by setting the in the following bits to 0x0 for the listed outputs:
 - The `DISPC_CONTROL1[0]` LCDENABLE bit for LCD1 output
 - The `DISPC_CONTROL2[0]` LCDENABLE bit for LCD2 output
 - The `DISPC_CONTROL3[0]` LCDENABLE bit for LCD3 output
 - The `DISPC_CONTROL1[1]` TVENABLE bit for TV output
 4. Enable the GFX pipeline by setting the `DISPC_GFX_ATTRIBUTES[0]` ENABLE bit to 0x1.
 5. Enable the DISPC output that corresponds with the overlay manager to which the GFX pipeline will be connected. This is done by setting the following bits to 0x1 for the listed outputs:
 - The `DISPC_CONTROL1[0]` LCDENABLE bit for LCD1 output
 - The `DISPC_CONTROL2[0]` LCDENABLE bit for LCD2 output
 - The `DISPC_CONTROL3[0]` LCDENABLE bit for LCD3 output
 - The `DISPC_CONTROL1[1]` TVENABLE bit for TV output

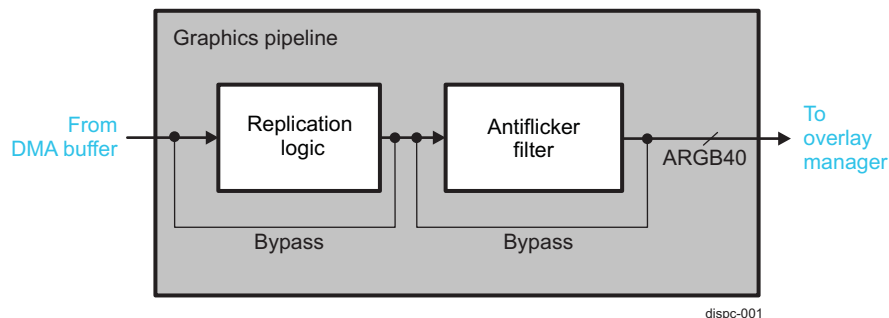

The pipeline consists of a programmable replication logic and an antiflicker filter. The replication logic is used to convert the RGB pixel formats into an ARGB40-based format. The antiflicker filter processes the graphics data in RGB format to remove some of the vertical flicker.

NOTE: The GFX pipeline does not include a scaler.

Table 11-93 lists the input formats supported by the graphics pipeline.

Figure 11-47 shows the graphics pipeline.

Figure 11-47. DISPC Graphics Pipeline

11.2.4.9.1 DISPC Replication Logic

The replication logic increases the color depth of the graphics-encoded pixels (from true color RGB 12, and 16 to 40 bpp).

- When the replication logic is enabled by setting the `DISPC_GFX_ATTRIBUTES[5]` REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSB. Table 11-94 describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 11-94. DISPC Replication Enabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

Format	A[9:0]	R[9:0]	G[9:0]	B[9:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	1111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBx12-4444	1111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGB16-565	1111111111	R[4:0]R[4:0]	G[5:0]G[5:2]	B[4:0]B[4:0]
xRGB16-1555	1111111111	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-1555	AAAAAAAAAA	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]

- When the replication logic is disabled by setting the [DISPC_GFX_ATTRIBUTES\[5\]](#) REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. [Table 11-95](#) describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 11-95. DISPC Replication Disabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

Format	A[7:0]	R[7:0]	G[7:0]	B[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB

RGB16-565	1111111111	R[4:0]000000	G[5:0]0000	B[4:0]000000
xRGB16-1555	1111111111	R[4:0]000000	G[4:0]000000	B[4:0]000000
ARGB16-1555	AAAAAAAAAA	R[4:0]000000	G[4:0]000000	B[4:0]000000
ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]000000	G[3:0]000000	B[3:0]000000
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]000000	G[3:0]000000	B[3:0]000000

11.2.4.9.2 DISPC Antiflicker Filter

The antiflicker filter processes the graphics data to remove some of the vertical flicker. It is based on a 3-tap FIR filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The antiflickering equations for A, R, G, and B components are:

$$A_{out}(x,y) = 0.25 \times A_{in}(x,y - 1) + 0.5 \times A_{in}(x,y) + 0.25 \times A_{in}(x,y + 1)$$

$$R_{out}(x,y) = 0.25 \times R_{in}(x,y - 1) + 0.5 \times R_{in}(x,y) + 0.25 \times R_{in}(x,y + 1)$$

$$G_{out}(x,y) = 0.25 \times G_{in}(x,y - 1) + 0.5 \times G_{in}(x,y) + 0.25 \times G_{in}(x,y + 1)$$

$$B_{out}(x,y) = 0.25 \times B_{in}(x,y - 1) + 0.5 \times B_{in}(x,y) + 0.25 \times B_{in}(x,y + 1)$$

For the first line of processing, because there is no pixel above, the value (x,y) is duplicated.

$$Out(x,y) = 0.25 \times In(x,y) + 0.5 \times In(x,y) + 0.25 \times In(x,y + 1)$$

For the last line of processing, because there is no pixel below, the value (x,y) is duplicated.

$$Out(x,y) = 0.25 \times In(x,y-1) + 0.5 \times In(x,y) + 0.25 \times In(x,y)$$

NOTE: Antiflicker filtering is supported only in RGB formats.

Antiflickering is not supported for pictures with fewer than two lines. In this case, the user must disable the antiflickering processing.

By default, the antiflicker filtering is disabled. It can be enabled by setting the [DISPC_GFX_ATTRIBUTES\[24\]](#) ANTIFLICKER bit to 0x1.

11.2.4.10 DISPC Video Pipelines

Three identical video pipelines are available, VID1, VID2, and VID3. Each video pipeline is connected to its video FIFO controller for the input port and to the four overlay managers, LCD1, LCD2, LCD3, and TV or WB pipeline. The pixel output is directed to the LCD, TV, or WB path by setting the DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT bit and the DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2 bit field. [Table 11-109](#) summarizes the bit field settings to orient a pipeline to LCD, TV, or WB output. The default value directs all video pipelines to LCD1.

NOTE: It is not possible to change the direction of the video pipelines on the fly. If a video pipeline needs to be connected to a different overlay manager than what it is currently connected, then the following steps need to be performed:

1. Disable the VIDp pipeline by setting the DISPC_VIDp_ATTRIBUTES[0] ENABLE bit to 0x0.
2. Direct the VIDp pipeline to the new overlay manager by modifying the [16] CHANNELOUT bit and the [31:30] CHANNELOUT2 bit in the DISPC_VIDp_ATTRIBUTES register.
3. Disable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x0 for the listed outputs:
 - The DISPC_CONTROL1[0] LCDENABLE bit for LCD1 output
 - The DISPC_CONTROL2[0] LCDENABLE bit for LCD2 output
 - The DISPC_CONTROL3[0] LCDENABLE bit for LCD3 output
 - The DISPC_CONTROL1[1] TVENABLE bit for TV output
4. Enable the VIDp pipeline by writing 0x1 to the DISPC_VIDp_ATTRIBUTES [0] ENABLE bit.
5. Enable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x1 for the listed outputs:
 - The DISPC_CONTROL1[0] LCDENABLE bit for LCD1
 - The DISPC_CONTROL2[0] LCDENABLE bit for LCD2 output
 - The DISPC_CONTROL3[0] LCDENABLE bit for LCD3 output
 - The DISPC_CONTROL1[1] TVENABLE bit for TV output

A video pipeline consists of a scaler unit, color space conversion (CSC) unit, VC-1 range mapping unit, and some programmable replication logic. The order of the video pipeline unit can be configured in two manners (see [Figure 11-48](#) and [Figure 11-49](#)):

- Configuration 1 (YUVCHROMARESAMPLING = 0): VC-1 range mapping unit followed by a CSC unit and then a scaler unit. The configuration is used to support RGB, ARGB, and RGBA formats and YUV4:2:2 in backward mode for both data types. Each block can be independently bypassed.
- Configuration 2 (YUVCHROMARESAMPLING = 1): VC-1 range mapping unit followed by a scaler unit and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats and YUV4:2:2, YUV420-NV12, and YUV420-NV21 formats, taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed.

The DISPC_VIDn_ATTRIBUTES2[8] YUVCHROMARESAMPLING bit controls the order of the scaler unit in the video pipeline:

- When the YUVCHROMARESAMPLING bit is set to 0x0, the video pipeline is in configuration 1, and the scaler comes after the CSC unit. In case of YUV input data in 4:2:2 format, the chrominance resampling (4:2:2 to 4:4:4 format) is done by averaging the chrominance adjacent samples for only 0 degrees (zero rotation), because other rotation (90/180/270 degrees) is not supported in this mode. For more information about the supported chrominance resampling methods, see [Section 11.2.4.10.3.1, Chrominance Resampling](#).
- When the YUVCHROMARESAMPLING bit is set to 0x1, the video pipeline is in configuration 2, and the scaler comes before the CSC unit.
 - In case of YUV4:2:2 input data with 90-/270-degree rotation, the data is preprocessed by

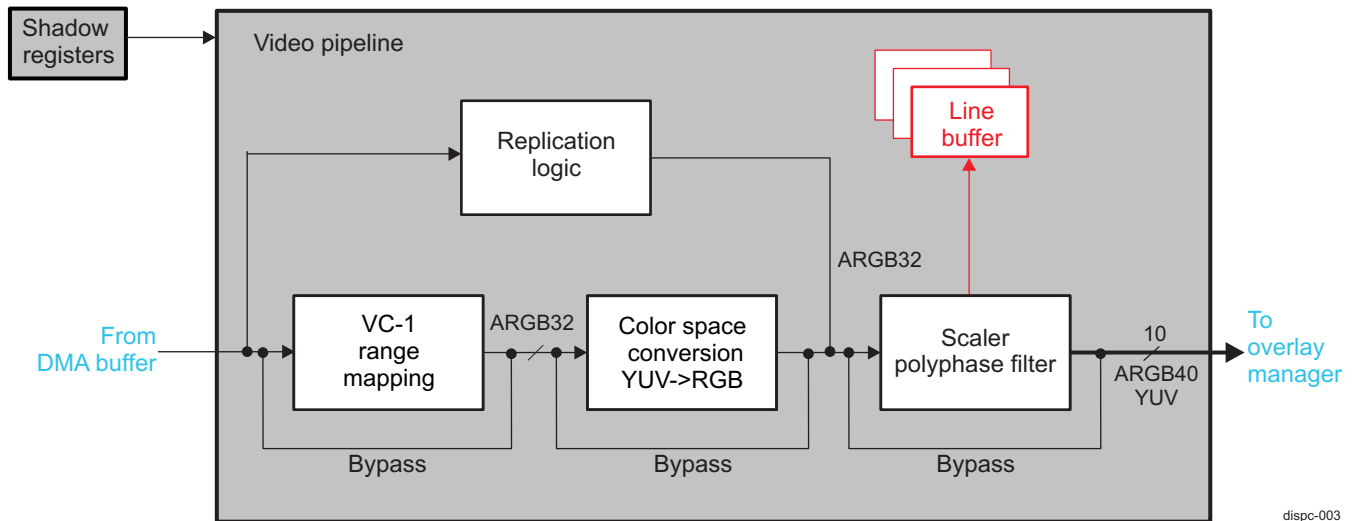

duplicating the missing chrominance samples.

- In case of YUV4:2:2 input data with 0-/180-degree rotation, the Chroma upsampling is performed in the scaler unit.

Table 11-93 lists the input formats supported by the video pipelines.

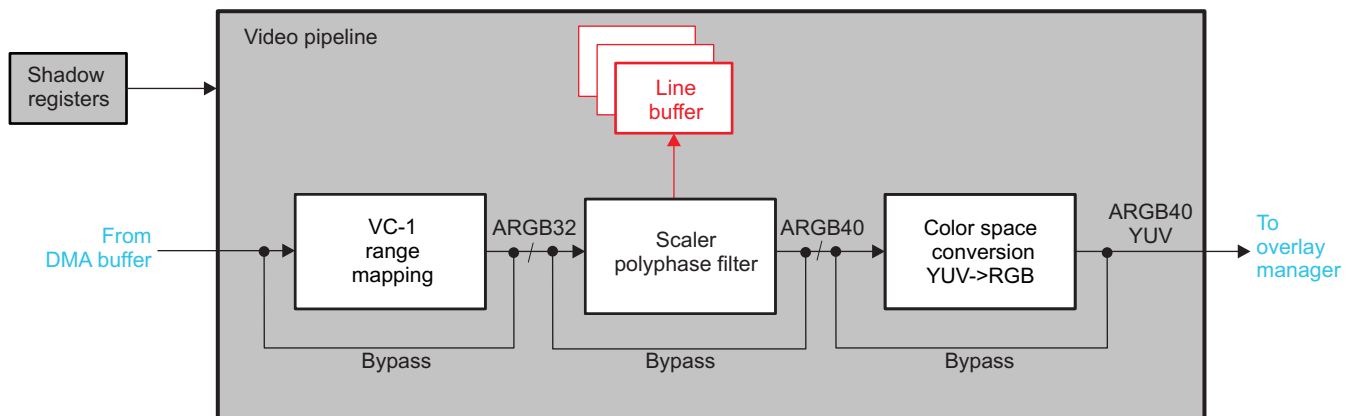

The video pipeline is enabled by setting the DISPC_VIDp_ATTRIBUTES[0] ENABLE bit to 0x1.

Figure 11-48. DISPC Configuration 1: Video Pipeline

dispc-003

Figure 11-49. DISPC Configuration 2: Video Pipeline

dispc-004

11.2.4.10.1 DISPC Replication Logic

The replication logic increases the color depth of the video-encoded pixels (from true color RGB 12, and 16 to 32 bpp) available only in configuration 1.

The expansion from 8- to 10-bit color component is done by the following units:

- The CSC unit, when the scaler is after the CSC module and when the vertical scaler is disabled
- The vertical scaler, when the scaler is after the CSC unit and enabled
- The replication bit module, when the CSC unit and scaler are disabled
- When the replication logic is enabled by setting the DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSBs. Table 11-96 describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 11-96. DISPC Replication Enabled: RGB Pixel Formats Remapping Into ARGB32-8888

Formats	A[7:0]	R[7:0]	G[7:0]	B[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	11111111	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGBx12-4444	11111111	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGB16-565	11111111	R[4:0]R[4:2]	G[5:0]G[5:4]	B[4:0]B[4:2]
xRGB16-1555	11111111	R[4:0]R[4:2]	G[4:0]G[4:2]	B[4:0]B[4:2]
ARGB16-1555	AAAAAAAA	R[4:0]R[4:2]	G[4:0]G[4:2]	B[4:0]B[4:2]
ARGB16-4444	A[3:0]A[3:0]	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGBA16-4444	A[3:0]A[3:0]	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]

- When the replication logic is disabled by setting the DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. [Table 11-97](#) describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 11-97. DISPC Replication Disabled: RGB Pixel Formats Remapping Into ARGB32-8888

11.2.4.10.2 DISPC VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 and YUV4:2:0-NV21 pixel formats but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE bit to 0x1. The DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y and DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = \text{CLIP}(((Y_{int} - 128) \times (\text{VC1_RANGE_Y} + 9) + 4) / 8) + 128)$$

$$C_b = \text{CLIP}(((C_b - 128) \times (\text{VC1_RANGE_CBCR} + 9) + 4) / 8) + 128)$$

$$C_r = \text{CLIP}(((C_r - 128) \times (\text{VC1_RANGE_CBCR} + 9) + 4) / 8) + 128)$$

NOTE: The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when minimum or maximum, respectively, are reached; otherwise, the resulting output remains identical.

11.2.4.10.3 DISPC CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB24 or RGB30 format. The output format depends on the video pipeline configuration selected:

- Configuration 1: RGB24 output format, with 8-bit value per component: red, green, and blue

- Configuration 2: RGB30 output format, with 10-bit value per component: red, green, and blue

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 11.2.4.10.3.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

Figure 11-50 through Figure 11-53 show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB24. The coefficients are set according to the standard used to encode the pixel data in YUV color space. Table 11-98 summarizes the coefficients with their respective bit fields.

Table 11-98. DISPC Color Space Conversion YUV to RGB Bit Field Setting

Coefficients	Bit Field Registers
R _Y	DISPC_VIDp_CONV_COEF0[10:0] RY
R _{Cr}	DISPC_VIDp_CONV_COEF0[26:16] RCR
R _{Cb}	DISPC_VIDp_CONV_COEF1[10:0] RCB
G _Y	DISPC_VIDp_CONV_COEF1[26:16] GY
G _{Cr}	DISPC_VIDp_CONV_COEF2[10:0] GCR
G _{Cb}	DISPC_VIDp_CONV_COEF2[26:16] GCB
B _Y	DISPC_VIDp_CONV_COEF3[10:0] BY
B _{Cr}	DISPC_VIDp_CONV_COEF3[26:16] BCR
B _{Cb}	DISPC_VIDp_CONV_COEF4[10:0] BCB

- For configuration 1 with an RGB24 output:

If the active range for the luminance samples (Y) is [235:16] and [240:16] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [255:0].

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

Figure 11-50. DISPC YCbCr to RGB Registers (FULLRANGE = 0), 8-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 16 \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [255:0], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [255:0].

Figure 11-51. DISPC YCbCr to RGB Registers (FULLRANGE = 1), 8-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-006

- For configuration 2 with an RGB30 output:

If the active range for the luminance samples (Y) is [940:64] and [960:64] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [1023:0].

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

Figure 11-52. DISPC YCbCr to RGB Registers (FULLRANGE = 0), 10-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 64 \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-074

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [1023:0], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [1023:0].

Figure 11-53. DISPC YCbCr to RGB Registers (FULLRANGE = 1), 10-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-075

11.2.4.10.3.1 DISPC Chrominance Resampling

Two methods are supported to resample chrominance:

- Averaging of the chrominance is done by software, followed by hardware conversion when the video pipeline is in configuration 1.
- Filtering of the chrominance using the scaler unit (chrominance resampling and rescaling can be combined to support native rescaling of YUV format) when the video pipeline is in configuration 2.

To convert the YUV4:2:2 encoded pixel values into YUV4:4:4 format, the averaging of the chrominance technique can be used as shown in Figure 11-54. The missing chrominance samples (Cb and Cr) are interpolated using the average values of the two closest values on the same line (,) or are repeated from the second pixel in the same 32-bit container (see Figure 11-55). For the last pixel, the chrominance samples are duplicated using the values from the previous pixel; otherwise, the chrominance samples are averaged using the two adjacent values. Figure 11-56 shows the flow of the pixel.

Figure 11-54. DISPC Averaging of the Chrominance Formula

$$Cb_n(YCbCr\ 444) = \frac{Cb_{n-1}(YCbCr\ 422) + Cb_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

$$Cr_n(YCbCr\ 444) = \frac{Cr_{n-1}(YCbCr\ 422) + Cr_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

dispc-010

Figure 11-55. DISPC Averaging of the Chrominance Representation

Figure 11-56. DISPC YUV4:2:2 to RGB30 Using Averaging of the Chrominance

disp-007

The scaler unit can be used to resample the chrominance of YUV4:2:0 and YUV4:2:2, as shown in [Figure 11-57](#) and [Figure 11-58](#), respectively. The settings of the scaler unit to perform chrominance resampling are described in [Section 11.2.4.10.4, DISPC Scaler Unit](#).

Figure 11-57. DISPC YUV4:2:0 to RGB30 Using Scaler Unit for Resampling Chrominance

disp-008

Figure 11-58. DISPC YUV4:2:2 to RGB30 Using Scaler Unit for Resampling Chrominance

disp-009

NOTE: If rotation must be supported, YUV4:2:2 and YUV4:2:0 (0-/180-degree rotation) chrominance resampling is done as shown in [Figure 11-58](#) and [Figure 11-57](#), respectively. For YUV4:2:2 (90-/270-degree rotation) data are preprocessed to present YUV4:4:4 on the scaler input (duplication of the missing chroma), as shown in [Figure 11-56](#).

11.2.4.10.4 DISPC Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Antiflicker reduction
- Spatial de-interlacing using bob algorithm
- Chrominance resampling in case of YUV data formats

NOTE: The user must ensure that the resizing frame displays in the LCD/screen boundaries.

[Figure 11-59](#) shows an example of video upsampling.

Figure 11-59. DISPC Video Upsampling

The upsampling and downsampling filter is a polyphase filter with five taps and eight phases for the horizontal filter, and a programmable number of taps (three or five) and eight phases for vertical filter. The input buffer has five input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x8.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
 - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
 - Using 3-tap configuration, no downscaling is available.

For vertical upsampling and downsampling in a 3-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * A_{in}(n+i)) \gg 5$	$Y_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi_y) * Y_{in}(n+i)) \gg 5$
$R_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * R_{in}(n+i)) \gg 5$	$Cr_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cb_{in}(n+i)) \gg 5$
$G_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * G_{in}(n+i)) \gg 5$	$Cb_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cr_{in}(n+i)) \gg 5$
$B_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * B_{in}(n+i)) \gg 5$	

dispc-013

(1)

For vertical upsampling and downsampling in a 5-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i)) \gg 5$	$Y_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi_y) * Y_{in}(n+i)) \gg 5$
$R_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i)) \gg 5$	$Cb_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cb_{in}(n+i)) \gg 5$
$G_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i)) \gg 5$	$Cr_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cr_{in}(n+i)) \gg 5$
$B_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i)) \gg 5$	

dispc-012

(2)

For horizontal upsampling and downsampling in a 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) \gg 7$ $R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) \gg 7$ $G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) \gg 7$ $B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) \gg 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * Y_{in}(n+i) \right) \gg 7$ $Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hcl}(\Phi_c) * Cb_{in}(n+i) \right) \gg 7$ $Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hcl}(\Phi_c) * Cr_{in}(n+i) \right) \gg 7$
--	---

dispc-014

(3)

NOTE: The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients Ci() depend on the phase between input and output pixels.

NOTE: The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of five lines of 2048 x 32 bits for both 3-tap and 5-tap configurations (see [Table 11-99](#)).

Table 11-99. DISPC Line Buffer Width for Scaler Unit

Vertical Taps	Maximum Input Width (Pixels)
3, 5	2048 x 32 bits

At the beginning of frame scaling processing, the first line is duplicated to fill the first two lines in 3-tap configuration and the first three lines in 5-tap configuration.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The video scalers have an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output and the horizontal scaling takes the 10-bit input.

[Figure 11-60](#) and [Figure 11-61](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 11-62](#) and [Figure 11-63](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [1023:0] or [960:64] by configuring the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit.

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

	Chc(2)		FIRHC0	DISPC_VIDp_FIR_COE F_H2_i

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE bit field.

A set of configurations must be valid before enabling the video upsampling and downsampling block.

The following fields define the configuration of the video upsampling downsampling block for VIDp:

- Vertical upsampling and downsampling increments the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{SIZEY}{MEMSIZEY} \right)$$

dispc-066

(4)

NOTE:

- If the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
 - If the DISPC_VIDp_SIZE[27:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
 - The values of the DISPC_VIDp_PICTURE_SIZE[27:16] MEMSIZEY and DISPC_VIDp_SIZE[27:16] SIZEY bit fields must be programmed with the value desired minus 1.
- Horizontal upsampling and downsampling increments the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{SIZEX}{MEMSIZEX} \right)$$

dispc-067

(5)

NOTE:

- If the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
 - If the DISPC_VIDp_SIZE[10:0] SIZEX bit field equals 1, SIZEX is replaced by 2 in the previous equation.
 - The values of the DISPC_VIDp_PICTURE_SIZE[10:0] MEMSIZEX and DISPC_VIDp_SIZE[10:0] SIZEX bit fields must be programmed with the value desired minus 1.
-
- Vertical up/downsampling accumulator value DISPC_VIDp_ACCU_j[26:16] VERTICALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register DISPC_VIDp_ACCU_0 is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
 - Vertical upsampling and downsampling line buffer configuration DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
 - Horizontal upsampling and downsampling accumulator value DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register DISPC_VIDp_ACCU_0 is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

Table 11-102 lists the DISPC vertical and horizontal accumulator values and phases.

Table 11-102. DISPC Vertical and Horizontal Accumulator Phase

Accumulator Value	Phases f
0	0
128 or −896	1
256 or −768	2
384 or −640	3
512 or −512	4
640 or −384	5
768 or −256	6
896 or −128	7

- Vertical upsampling and downsampling coefficients:
 - The 3-tap vertical upsampling and downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_HV_i registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical upsampling and downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
 - The 5-tap vertical upsampling and downsampling coefficients: Two extra-tap vertical upsampling and downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_V_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical upsampling downsampling block are used in addition to the 3-tap registers previously defined.

Four YUV vertical upsampling and downsampling coefficients are set in DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_V2_i registers. Table 11-100 and Table 11-101 summarize all coefficients and their respective registers.
- Horizontal upsampling and downsampling coefficients:

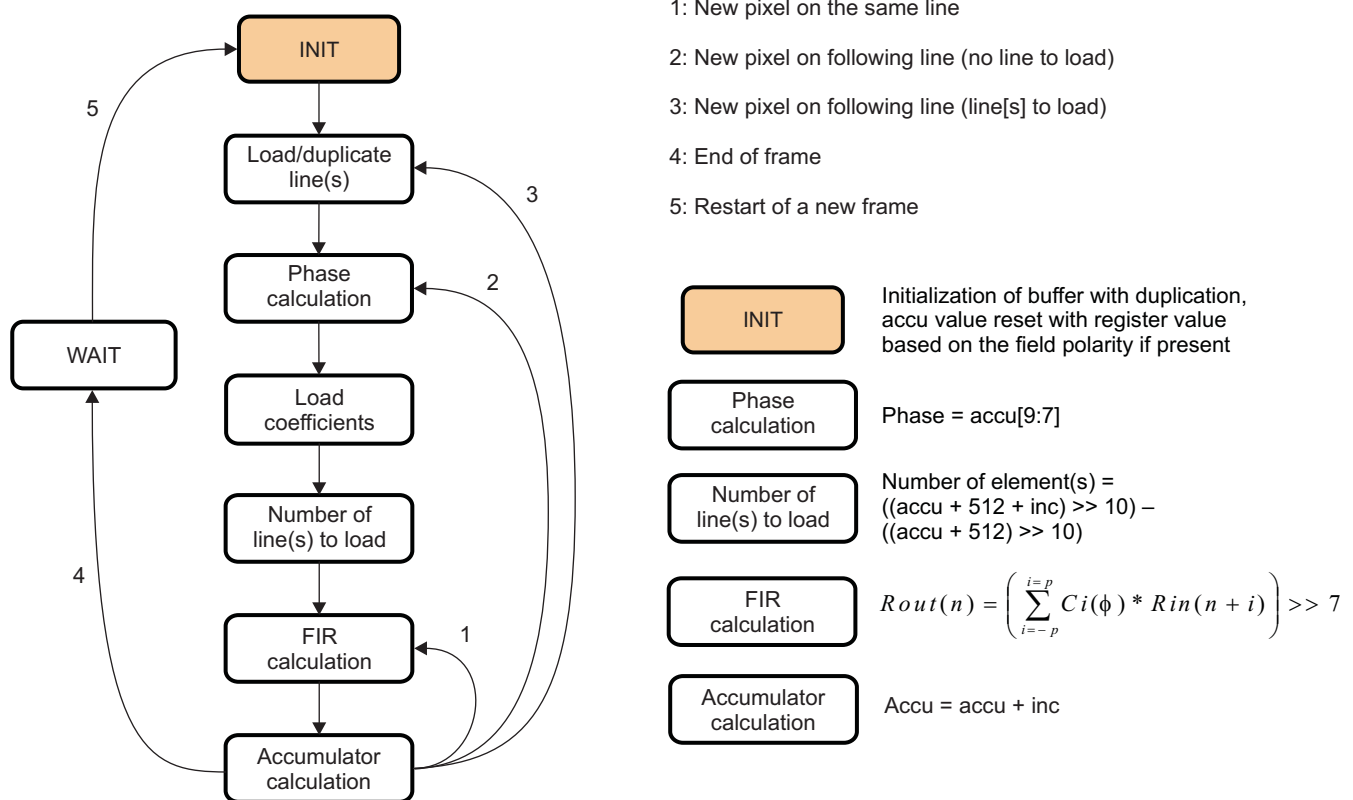

- The DISPC_VIDp_FIR_COEF_H_i and DISPC_VIDp_FIR_COEF_HV_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC_VIDp_FIR_COEF_H_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC_VIDp_FIR_COEF_HV_i register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal upsampling and downsampling block are used.

Four YUV horizontal upsampling and downsampling coefficients are set in the DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_H2_i registers. Table 11-100 and Table 11-101 summarize all coefficients and their respective registers.

dispc-087

11.2.4.10.4.2 DISPC Scaling limitations

Table 11-103 lists the minimum ratio between the pixel clock frequency (DSS_DISPC_LCDn_PCLK) and the functional clock (F_CLK) in the input pixel format when using the scaler unit. DSS_DISPC_LCDn_PCLK and F_CLK are asynchronous. For each LCD output, a dedicated LCD clock is programmable with the LCD and PCD divisor values in DISPC_DIVISORo[23:16][7:0].

NOTE: The F_CLK is derived from DSS_FCLK through the LCD divisor.

NOTE: The downscaling ratio is not an integer, it is the ratio F_CLK / DSS_DISPC_LCDn_PCLK, meaning if the ratio is 2.7, then the downscaling ratio is 2.7 and not 2.

Table 11-103. DISPC Pixel Clock Frequency Limitations (Any Pixel Format) – Active Matrix Display

F_CLK/DSS_DISPC_LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	2 or 1 ⁽¹⁾	2 or 1 ⁽¹⁾	2	3	4

⁽¹⁾ The minimum ratio can be 1 if the data are output on the rising edge of the PCLK (DISPC_POL_FREQo.IPC = 0 and CTRL_CORE_SMA_SW_1[DSS_CHx_IPC]); otherwise, the minimum ratio must be 2.

11.2.4.11 DISPC Write-Back Pipeline

The write-back pipeline is used to store in the system memory the capture of the overlay output or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB32-8888 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

The write-back pipeline is connected to all the pipeline outputs (GFX, VD1, VID2, and VID3 pipelines) and to the output of the three overlay managers (LCD1, LCD2, LCD3, and TV). The input is selected by setting the `DISPC_WB_ATTRIBUTES[18:16] CHANNELIN` bit field, and the capture frame rate is set in the `DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE` bit field.

Because the output format of the TV overlay manager is ARGB40, the graphics pipeline output is ARGB40, the video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB40, and the write-back input is ARGB32, the write-back input does not consider the 2 LSBs of each ARGB component.

The write-back pipeline is enabled by setting the `DISPC_WB_ATTRIBUTES[0] ENABLE` bit to 0x1.

Figure 11-66 shows the graphics pipeline.

Figure 11-66. DISPC Write-Back Pipeline

dispc-016

11.2.4.11.1 DISPC Write-Back CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance sub-sampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.25

Figure 11-67 and Figure 11-68 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 11-104 lists the coefficients with their respective bit fields.

Table 11-104. DISPC CSC RGB to YUV Bit Field Setting

Coefficients	Bit Fields
Y _R	DISPC_WB_CONV_COEF0[10:0] YR
Y _G	DISPC_WB_CONV_COEF0[26:16] YG
Y _B	DISPC_WB_CONV_COEF1[10:0] YB

Table 11-104. DISPC CSC RGB to YUV Bit Field Setting (continued)

Coefficients	Bit Fields
Cr _R	DISPC_WB_CONV_COEF1[26:16] CRR
Cr _G	DISPC_WB_CONV_COEF2[10:0] CRG
Cr _B	DISPC_WB_CONV_COEF2[26:16] CRB
Cb _R	DISPC_WB_CONV_COEF3[10:0] CBR
Cb _G	DISPC_WB_CONV_COEF3[26:16] CBG
Cb _B	DISPC_WB_CONV_COEF4[10:0] CBB

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the [DISPC_WB_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x0.

Figure 11-67. DISPC RGB to YCbCr (FULLRANGE = 0)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the [DISPC_WB_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x1.

Figure 11-68. DISPC RGB to YCbCr (FULLRANGE = 1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \end{bmatrix}$$

dispc-018

11.2.4.11.2 DISPC Write-Back Scaler Unit

The functional aspect of the write-back pipeline scaler unit is identical to the video pipeline scaler unit (see [Section 11.2.4.10.4, DISPC Scaler Unit](#)), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB40. In addition, the scaling limitations described in [Section 11.2.4.10.4.2](#) are relevant only to the video pipelines scaler units. In write-back memory-to-memory mode there are no limitations on the F_CLK/DSS_DISPC_LCDn_PCLK ratio for horizontal resampling.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The write-back scaler component has an 8-bit input and an 8-bit output.

[Figure 11-69](#) and [Figure 11-70](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 11-71](#) and [Figure 11-72](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the [DISPC_WB_ATTRIBUTES\[11\] FULLRANGE](#) bit.

Figure 11-69. DISPC Macro-Architecture of the Vertical Scaling for A, R, G, B, and Y Components

	Chc(0)	N/A	FIRHC2	DISPC_WB_FIR_COEF_H2_i
	Chc(1)		FIRHC1	DISPC_WB_FIR_COEF_H2_i
	Chc(2)		FIRHC0	DISPC_WB_FIR_COEF_H2_i

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_WB_ATTRIBUTES\[6:5\] RESIZEENABLE](#) bit field.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of the [DISPC_WB_FIR\[28:16\] FIRVINC](#) bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{SIZEY}{MEMSIZEY} \right)$$

dispc-066

(6)

NOTE:

- If the value of the [DISPC_WB_FIR\[28:16\] FIRVINC](#) bit field is greater than 4096, it is clipped to 4096.
 - If the [DISPC_WB_SIZE\[27:16\] SIZEY](#) bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
 - The values of the [DISPC_WB_PICTURE_SIZE\[27:16\] MEMSIZEY](#) and [DISPC_WB_SIZE\[27:16\] SIZEY](#) bit fields must be programmed with the value desired minus 1.
- Horizontal up/downsampling increments the value of the [DISPC_WB_FIR\[12:0\] FIRHINC](#) bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{SIZEX}{MEMSIZEX} \right)$$

dispc-067

(7)

NOTE:

- If the value of the `DISPC_WB_FIR[12:0]` FIRHINC bit field is greater than 4096, it is clipped to 4096.
 - If the `DISPC_WB_SIZE[10:0]` SIZEX bit field equals 1, the `DISPC_WB_SIZE[10:0]` SIZEX bit field is replaced by 2 in the previous equation.
 - The value of the `DISPC_WB_PICTURE_SIZE[10:0]` MEMSIZEX and `DISPC_WB_SIZE[10:0]` SIZEX bit fields must be programmed with the value desired minus 1.
-
- Vertical up/downsampling accumulator value `DISPC_WB_ACCU_j[26:16]` VERTICALACCU bit field: The signed integer value range is $[-1024:1023]$. The accumulator value indicates on which phase the vertical filtering starts. The register `DISPC_WB_ACCU_0` is used for progressive output and for interlace output the `DISPC_WB_ACCU_0` and `DISPC_WB_ACCU_1` registers are used. Similarly, `DISPC_WB_ACCU2_0` and `DISPC_WB_ACCU2_1` are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
 - Vertical up/downsampling line buffer configuration `DISPC_WB_ATTRIBUTES[21]` VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
 - Horizontal up/downsampling accumulator value `DISPC_WB_ACCU_j[10:0]` HORIZONTALACCU bit field: The signed integer value range is $[-1024:1023]$. The accumulator value indicates on which phase the horizontal filtering starts. The register `DISPC_WB_ACCU_0` is used for progressive output and for interlace output the `DISPC_WB_ACCU_0` and `DISPC_WB_ACCU_1` registers are used. Similarly, `DISPC_WB_ACCU2_0` and `DISPC_WB_ACCU2_1` are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

Table 11-107 lists the DISPC vertical and horizontal accumulator values and phases.

Table 11-107. DISPC Vertical/Horizontal Accumulator Phase

Accumulator Value	Phases f
0	0
128 or -896	1
256 or -768	2
384 or -640	3
512 or -512	4
640 or -384	5
768 or -256	6
896 or -128	7

- Vertical up/downsampling coefficients:
 - The 3-tap vertical up/downsampling coefficients are defined in the `DISPC_WB_FIR_COEF_HV_i` registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
 - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the `DISPC_WB_FIR_COEF_V_i` registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined.

Four YUV vertical up/downsampling coefficients are set in the `DISPC_WB_FIR_COEF_HV2_i` and `DISPC_WB_FIR_COEF_V2_i` registers. Table 11-105 and Table 11-106 summarize all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:
 - The `DISPC_WB_FIR_COEF_H_i` and `DISPC_WB_FIR_COEF_HV_i` registers define the 5-tap horizontal up/downsampling coefficients. Each `DISPC_WB_FIR_COEF_H_i` register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each

[DISPC_WB_FIR_COEF_HV_i](#) register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used.

Four YUV horizontal up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_HV2_i](#) and [DISPC_WB_FIR_COEF_H2_i](#) registers. [Table 11-105](#) and [Table 11-106](#) summarize all coefficients and their respective registers.

11.2.4.11.3 DISPC Write-Back RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12- or 16-bit format based. Setting the [DISPC_WB_ATTRIBUTES\[10\]](#) TRUNCATIONENABLE bit to 0x1 enables the truncation to the pixel format defined by the [DISPC_WB_ATTRIBUTES\[4:1\]](#) FORMAT bit field. The truncation is done by removing the necessary LSB of each component to match the output format. [Table 11-108](#) describes the truncation done on each component of the pixel.

Table 11-108. DISPC Truncation Logic

Output Formats	A[7:0]	R[7:0]	G[7:0]	B[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGBx12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGB16-565	Ignored	R[7:3]	G[7:2]	B[7:3]
xRGB16-1555	Ignored	R[7:3]	G[7:3]	B[7:3]
ARGB16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
RGBA16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
ARGB16-1555	A[7]	R[7:3]	G[7:3]	B[7:3]

NOTE: If there is no alpha field in the pixel format description, 0s or 1s must fill the container. 0s must be used for transparent and 1s for opaque. For example, in xRGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

11.2.4.12 DISPC Hardware Cursor

The video layer or graphics layer can be used to display the hardware cursor. The encoded pixel data for the cursor image are in one of the following formats if the source transparency color key is used:

- xRGB12-4444
- ARGB16-4444
- RGBx12-4444
- RGBA16-4444
- ARGB16-1555
- RGB16-565
- RGB24-888
- xRGB24-88888
- RGBA32-8888
- BGRA32-8888
- ARGB32-8888

Otherwise, any pixel format can be used for the cursor image, considering the limitation in terms of pixels supported by the pipeline used to display the cursor image. To display a nonrectangle cursor, the transparency color key or alpha blending (pixel alpha blending) can be used (see [Section 11.2.4.13.1.3, DISPC Transparency Color Keys](#)). Global alpha blending can be used in addition to the transparency source color key to create a fading effect when the cursor (with a nonrectangle shape) appears and disappears on the screen. The image of the cursor can be stored entirely inside the DMA buffer to use the self-refresh mode (see [Section 11.2.4.6.8.2, DISPC DMA Ultralow-Power Mode](#)). In that case, the image is loaded once and then displayed without accessing the system memory for loading the image for each frame. This saves bandwidth on interconnect and memory.

11.2.4.13 DISPC LCD Outputs

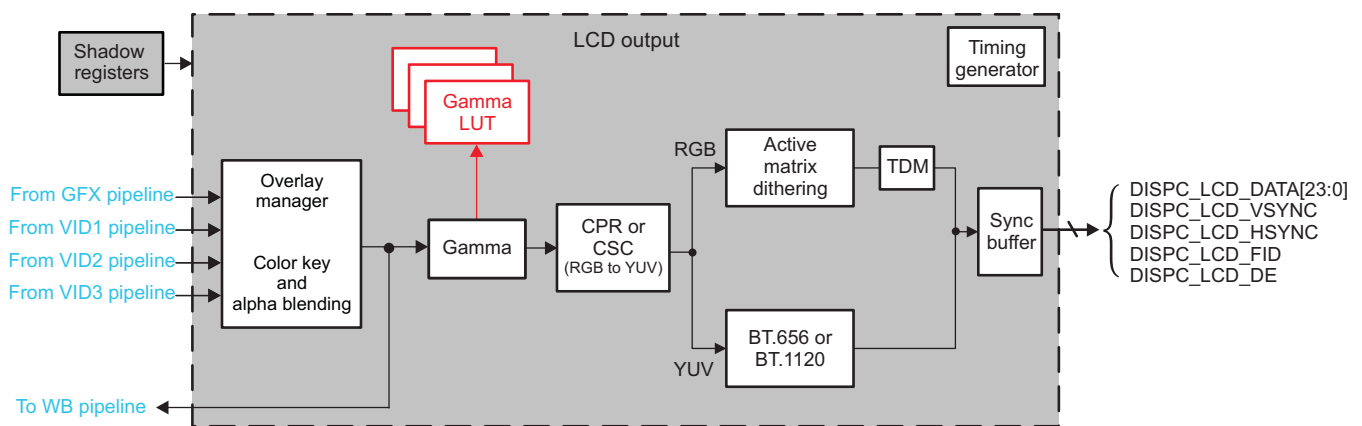

The LCD1, LCD2, LCD3 output paths consist of several processing blocks (see [Figure 11-73](#)):

- Overlay manager
- Gamma correction unit
- Color phase rotation (CPR) block, also used for RGB-to-YUV color space conversion (CSC)
- Active matrix dithering with TDM
- BT.656
- BT.1120
- Synchronization buffer
- Timing generator

The display subsystem supports active matrix technologie (monochrome and color modes):

- Active matrix displays: the configuration of colors depends on the color depth:
 - 24 bpp supports 16,777,216 colors.
 - 18 bpp supports 262,144 colors.
 - 16 bpp supports 65,536 colors.
 - 12 bpp supports 4096 colors.

Figure 11-73. DISPC LCD Output Architecture

dispc-028

NOTE: In BT.656 mode only bits 9 through 0 are used from DISPC_LCD_DATA[23:0] data bus.

11.2.4.13.1 DISPC Overlay Manager

The overlay mechanism consists of displaying more than one layer (GFX, VID1, VID2, and VID3 layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.

- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

Each pipeline (GFX, VID1, VID2, and VID3) is assigned to a single overlay and, as a consequence, to a single display controller output, LCD1, LCD2, LCD3, TV, or WB pipeline. An overlay manager can be connected to all four pipelines outputs simultaneously. The pipeline output is directed using the [DISPC_GFX_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC_VIDp_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 11-109](#) summarizes the bit field settings to direct a pipeline to an LCD/TV or WB output. The default value directs all pipelines to LCD1.

Table 11-109. DISPC Pipeline Connection to LCD, TV, or WB Output

Overlay Manager/Output	DISPC_GFX_ATTRIBUTES/DISPC_VIDp_ATTRIBUTES	
	CHANNELOUT Bit	CHANNELOUT2 Bit Field
LCD1	0x0	0x0
LCD2	0x0	0x1
LCD3	0x0	0x2
WB	0x0	0x3
TV	0x1	0x0 (See the following note)

NOTE: When CHANNELOUT = 0x1, the settings CHANNELOUT2 = 0x0, 0x1, 0x2, and 0x3 are reserved.

The output of each LCD overlay manager is connected to CPR block through the gamma table unit in the case of gamma correction.

NOTE: When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.

11.2.4.13.1.1 DISPC Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 11.2.4.13.1.2, DISPC ALPHA Blender](#), and [Section 11.2.4.13.1.3, DISPC Transparency Color Keys](#)). The Z-order is enabled by setting the [DISPC_GFX_ATTRIBUTES\[25\]](#) ZORDERENABLE bit or the [DISPC_VIDp_ATTRIBUTES\[25\]](#) ZORDERENABLE bit to 0x1 and by defining the Z-order in the [DISPC_GFX_ATTRIBUTES\[27:26\]](#) and [DISPC_VIDp_ATTRIBUTES\[27:26\]](#) ZORDER bit fields. [Table 11-110](#) summarizes the register settings to enable and set the Z-order of a pipeline. [Table 11-110](#) shows the default Z-order values when LCDALPHABLENDERENABLE and ZORDERENABLE are disabled.

Table 11-110. DISPC Z-Order Register Settings and Default Configuration

Pipeline	LCDALPHA BLENDERENABLE ⁽¹⁾	ZORDERENABLE	ZORDER	Resulting Z-Order Number
GFX	0	0	Don't care	0
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	3
VID1	0	0	Don't care	1
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	0

⁽¹⁾ Applies only to LCD1

Table 11-110. DISPC Z-Order Register Settings and Default Configuration (continued)

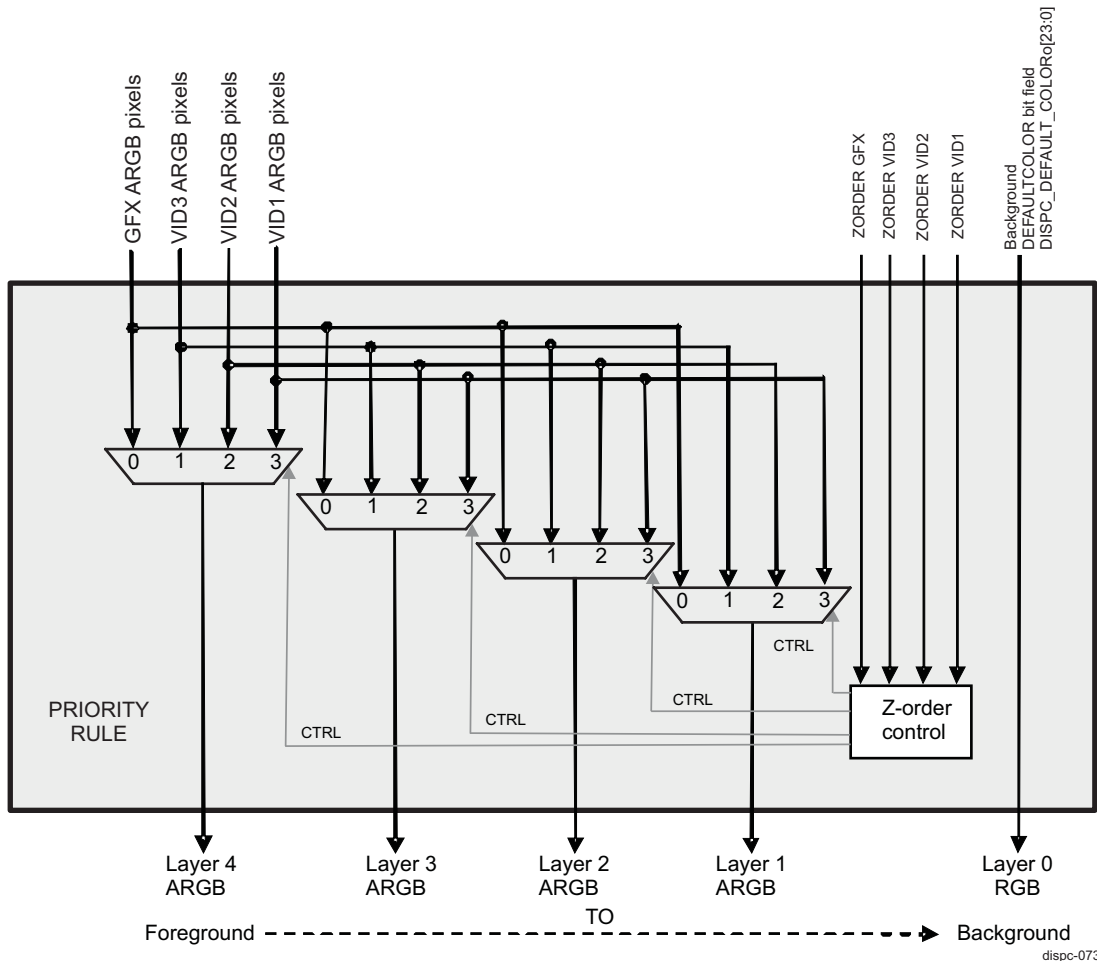

Pipeline	LCDALPHA BLENDERENABLE ⁽¹⁾	ZORDERENABLE	ZORDER	Resulting Z-Order Number
VID2	0	0	Don't care	2
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	1
VID3	0	0	Don't care	3
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	2

Figure 11-74 shows the architecture of the priority rule.

NOTE:

- If ZORDERENABLE = 1, each Z-order must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.
- Two modes are maintained for backward compatibility with legacy devices:
 - LCDALPHABLENDERENABLE = 0 and ZORDERENABLE = 0 equivalent to the normal mode overlay settings
 - LCDALPHABLENDERENABLE = 1 equivalent to the alpha mode overlay settings

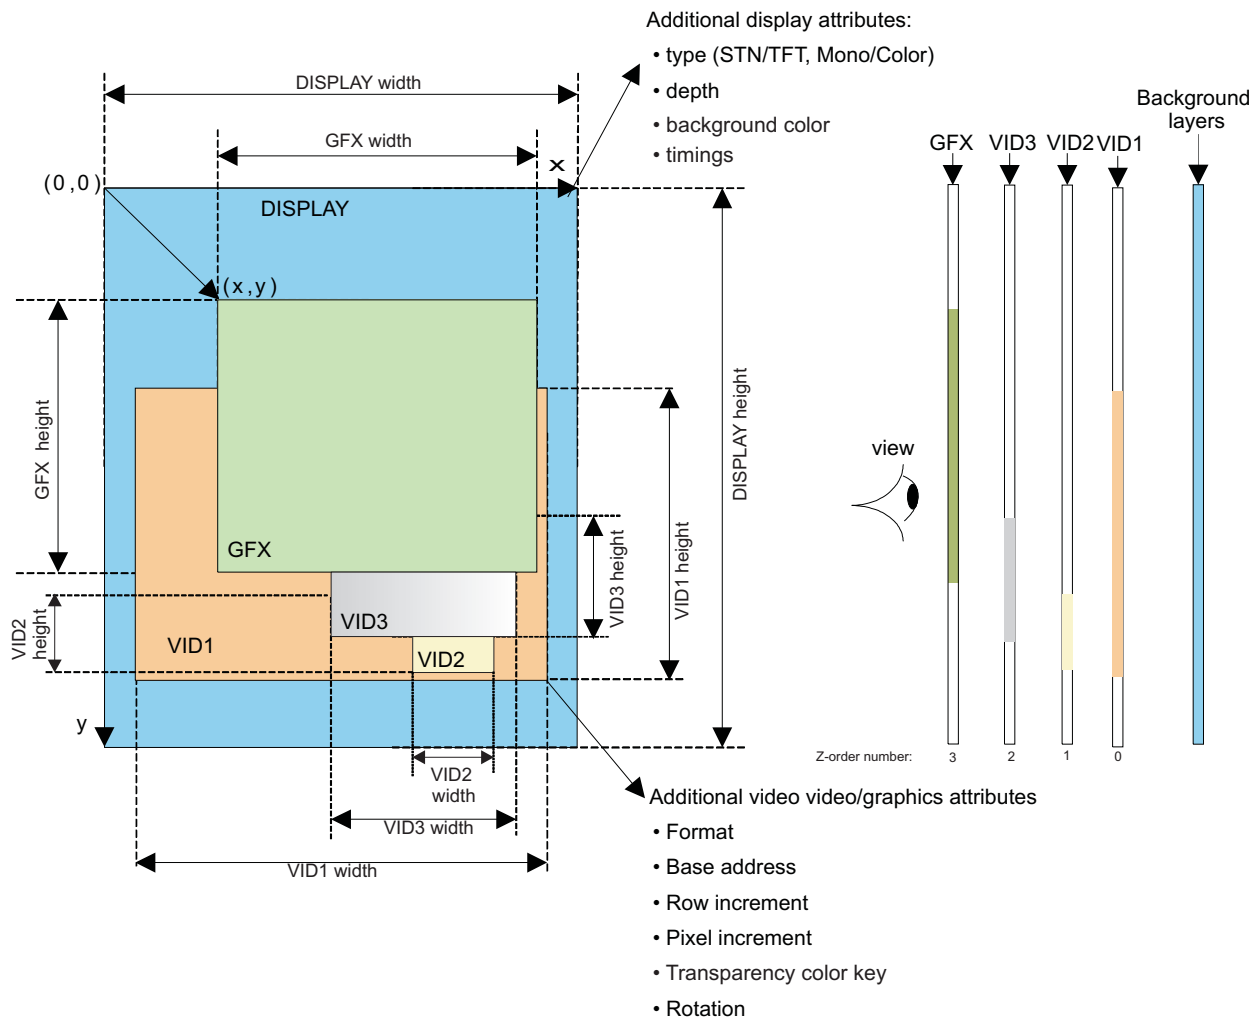

Figure 11-74. DISPC Priority Rule Architecture

The height and width of each enabled layer (pipeline) must be defined in the SIZEY and SIZEX bit fields [DISPC_GFX_SIZE\[27:16\]\[10:0\]](#) / [DISPC_VIDp_SIZE\[27:16\]\[10:0\]](#), and its x and y positions defined in the POSX and POSY bit fields [DISPC_GFX_POSITION\[26:16\]\[10:0\]](#) / [DISPC_VIDp_POSITION\[26:16\]\[10:0\]](#). If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC_DEFAULT_COLORo\[23:0\]](#) DEFAULTCOLOR bit field. [Figure 11-75](#) is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order—from background to foreground.

Figure 11-75. DISPC Example of Priority Rule: From Lower to Higher VID1, VID2, VID3, GFX

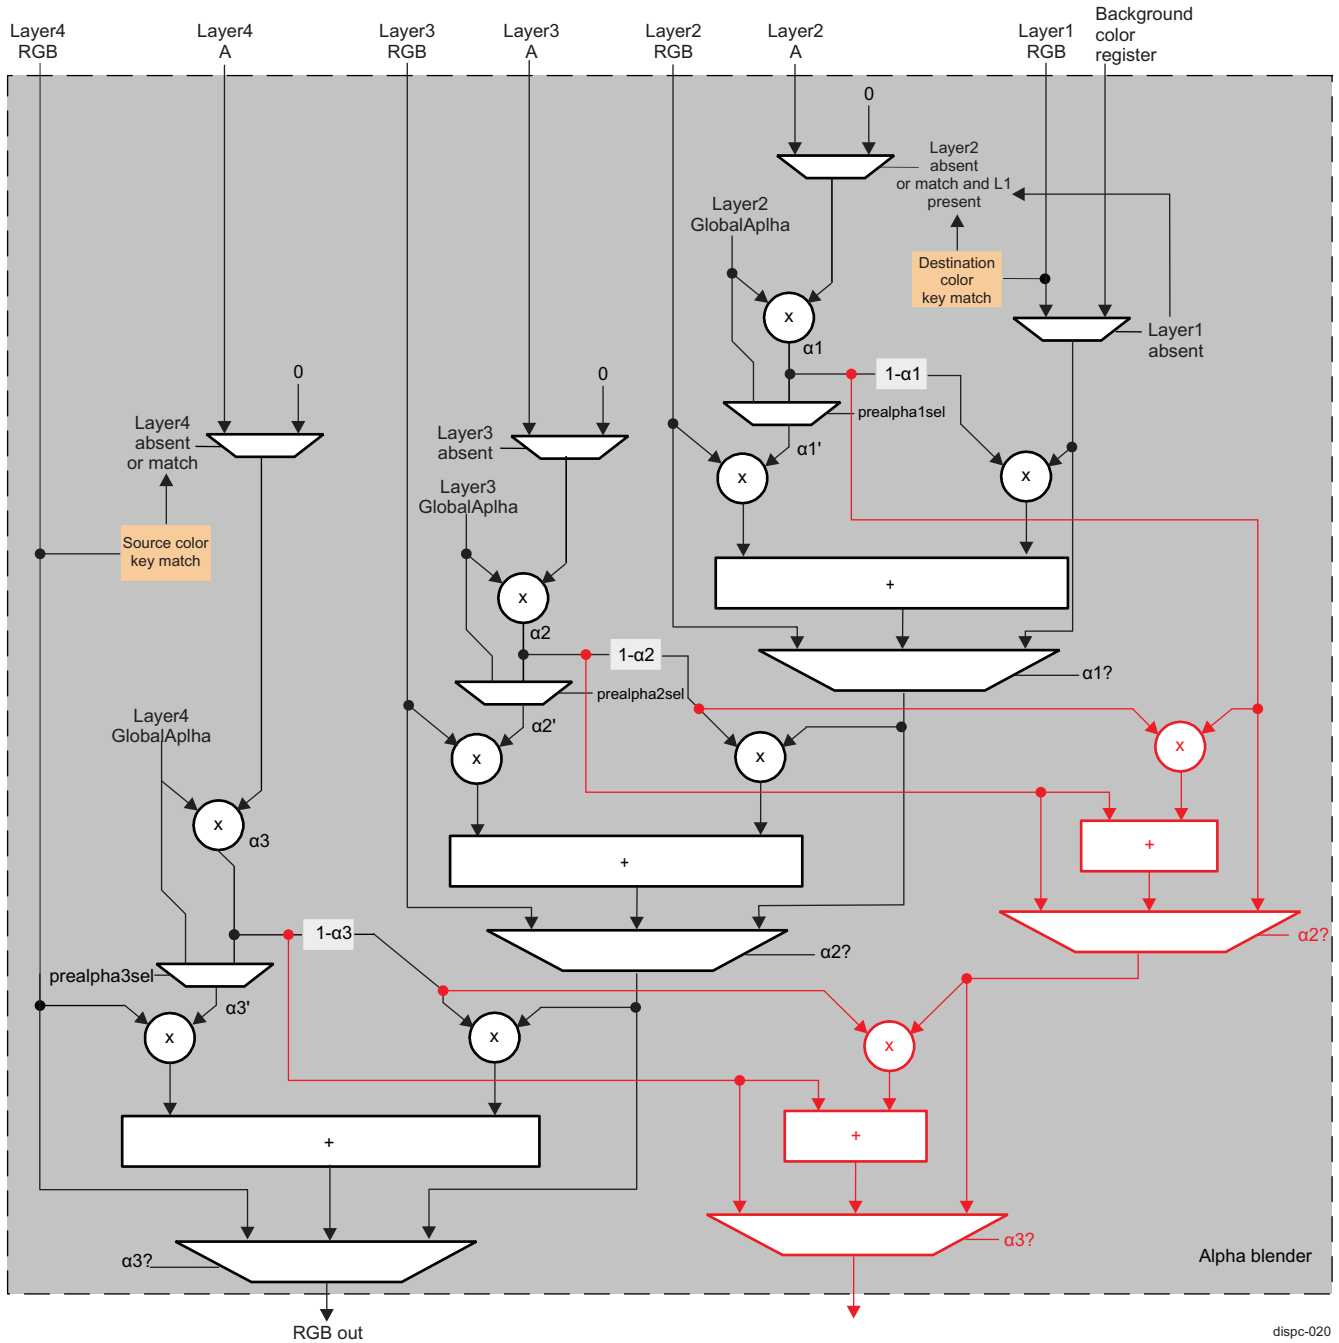

dispc-019

The DISPC is capable of outputting simultaneously two graphic/video windows in frame packing mode. Framepacking mode is enabled from [DISPC_GFX_ATTRIBUTES\[10\]](#) FRAMEPACKINGMODE / [DISPC_VIDp_ATTRIBUTES\[8\]](#) FRAMEPACKINGMODE. The position of the second graphic/video windows is defined in [DISPC_GFX_POSITION2](#) / [DISPC_VIDp_POSITION2](#) registers. The size is again defined in SIZEY and SIZEX bit fields of [DISPC_GFX_SIZE\[27:16\]\[10:0\]](#) / [DISPC_VIDp_SIZE\[27:16\]\[10:0\]](#) registers.

11.2.4.13.1.2 DISPC Alpha Blender

[Figure 11-76](#) shows the alpha blending processing in detail.

Figure 11-76. DISPC Alpha Blending Architecture With Premultiplied Alpha Support

dispc-020

CAUTION

The Z order of the Source Transparency Layer must have the value 3 (0x3: Z-order 3: layer above all the other layers).

NOTE: 1-alpha operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.

- For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see [Table 11-111](#)).
- For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see [Table 11-111](#)).
- If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF and if alpha is equal to 0xFF, there is no multiplication.
- For YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the YUV format is used.
- The global alpha blending value set in the individual bit fields of the [DISPC_GLOBAL_ALPHA](#) register for LCD:
 - VID3GLOBALALPHA
 - VID2GLOBALALPHA
 - VID1GLOBALALPHA
 - GFXGLOBALALPHA
- A total alpha blending value can be used when a combination of the pixel alpha blending value A and a global alpha blending is present. The resulting alpha value is determined as: Alpha = (Pixel Alpha × Global Alpha) / 256.

[Table 11-111](#) lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

Table 11-111. DISPC Alpha Blending – ARGB

Alpha Blending 1-Bit Value	Alpha Blending 4-Bit Value	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	Percent Blending
0x0	0x0	0x00	100 (transparent)
N/A	0x1	0x11	93.33
N/A	0x2	0x22	86.6
N/A
N/A	0xE	0xEE	6.6
0x1	0xF	0xFF	0 (opaque)

Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A * R$
- $G = A * G$
- $B = A * B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with $(1-A) \times$ Global Alpha.

The additional premultiplied alpha option is associated with the pipelines GFX, VID1, VID2, and VID3. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC_GFX_ATTRIBUTES](#)
- [DISPC_VID1_ATTRIBUTES](#)
- [DISPC_VID2_ATTRIBUTES](#)
- [DISPC_VID3_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

NOTE: The *prealpha* controls in [Figure 11-76](#), correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

The logic marked in red in [Figure 11-76](#) corresponds to the alpha value, computed when the write-back channel copies back to memory the premultiplied color component: $A(\text{destination}) = A(\text{source}) + (1-A(\text{source})) \times A(\text{destination})$

When the `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is cleared, or when the overlay channel is not selected for WB, the computation of the A(destination) is disabled. The default value for `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- The ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.
- The ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

NOTE: The `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

11.2.4.13.1.3 DISPC Transparency Color Keys

The two transparency color keys are the source transparency color key and the destination transparency color key. The transparency color key can be used only with RGB formats (ARGB, RGB, RGBA, xRGB, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some care because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- `DISPC_CONFIG1[10]` TCKLCDENABLE (for LCD1)
- `DISPC_CONFIG2[10]` TCKLCDENABLE (for LCD2)
- `DISPC_CONFIG3[10]` TCKLCDENABLE (for LCD3)
- `DISPC_CONFIG1[12]` TCKTVENABLE (for TV)

The transparency color key is determined in the following bit fields.

- `DISPC_TRANS_COLOR0[23:0]` TRANSCOLORKEY (for LCD1)
- `DISPC_TRANS_COLOR2[23:0]` TRANSCOLORKEY (for LCD2)
- `DISPC_TRANS_COLOR3[23:0]` TRANSCOLORKEY (for LCD3)
- `DISPC_TRANS_COLOR1[23:0]` TRANSCOLORKEY (for TV)

NOTE: The video source transparency color key and graphics destination transparency color key cannot be active at the same time.

- Video source transparency color key

The value of the video source transparency color key defines the encoded pixel data considered as a transparent pixel. The encoded pixel values with the source color key value are not visible, and the encoded pixel values of the under layers or solid background color are visible (the pixel alpha blending value of layer 4 is forced to 0x00, fully transparent).

The scaler can be enabled as a preprocessor in the VID pipeline, but it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bits to 0x1:

- `DISPC_CONFIG1[11]` TCKLCDSELECTION (for LCD1)

- DISPC_CONFIG2[11] TCKLCDSELECTION (for LCD2)
- DISPC_CONFIG3[11] TCKLCDSELECTION (for LCD3)
- DISPC_CONFIG1[13] TCKTVENABLE (for TV)

Figure 11-77 shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

Figure 11-77. DISPC Source Transparency Color Key Example

dispc-021

- Graphics destination transparency color key value

The graphics destination transparency color key value defines the encoded pixels in layer 1, which are not displayed. Other layer 1 pixels (nonequal to destination transparency color key) are displayed over layer 2. The encoded pixel values with the destination color key value are pixels not visible on the screen because pixels at the same position in layer 2 are visible; otherwise, encoded pixels are visible above layer 2. The destination transparency color key applies only if layer 1 overlaps layer 2 (see the Z-order section for details on layer position depending on the Z-order parameter in [Section 11.2.4.13.1.1, Priority Rule](#)); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipeline. It is necessary, however, to consider the pixel scaling preprocessing in order to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bits to 0x0:

- DISPC_CONFIG1[11] TCKLCDSELECTION (for LCD1)
- DISPC_CONFIG2[11] TCKLCDSELECTION (for LCD2)
- DISPC_CONFIG3[11] TCKLCDSELECTION (for LCD3)
- DISPC_CONFIG1[13] TCKTVSELECTION (for TV)

Figure 11-78 shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

Figure 11-78. DISPC Destination Transparency Color Key Example

11.2.4.13.1.4 DISPC Overlay Optimization

The overlay optimization consists in fetching only the required pixels (that is, pixels that contribute to the final picture to be displayed [LCD1, LCD2, LCD3, or TV]). The decision to fetch the pixel from memory is based on the information available in the registers and on the following rules:

- The layer is enabled.
- The global alpha blending factor for the layer is different than 0x00.
- The current layer is behind a nonopaque layer (global alpha blending factor is different than 0xFF for the layer in the preceding).

The result of the overlay optimization is a reduction of the bandwidth by fetching only the mandatory pixels. The overlay mechanism is independent for each overlay: LCD1, LCD2, LCD3, and TV. Because each layer (GFX, VID1, VID2, and VID3) can be associated to only one overlay at a time, it is possible to optimize the fetch of the pixels for each layer based on the overlay information. The overlay optimization must be run on the DMA engine time window and not on the display time window. The pixels are fetched by the DMA engine before the display processing.

The overlay optimization is enabled by setting the following bits to 0x1:

- [DISPC_CONTROL1](#)[12] OVERLAYOPTIMIZATION (for LCD1)
- [DISPC_CONTROL2](#)[12] OVERLAYOPTIMIZATION (for LCD2)
- [DISPC_CONTROL3](#)[12] OVERLAYOPTIMIZATION (for LCD3)
- [DISPC_CONTROL2](#)[13] TVOVERLAYOPTIMIZATION (for TV)

NOTE:

- The pixel alpha blending factor in case of ARGB and RGBA formats cannot be used to take advantage of the pixel fully transparent (alpha blending factor equals 0x00).
 - By default, the overlay optimization is disabled (OVERLAYOPTIMIZATION bits = 0x0 for all DISPC outputs), and all the data for all the enabled pipelines are fetched from memory regardless of the overlay or alpha blending configuration.
-

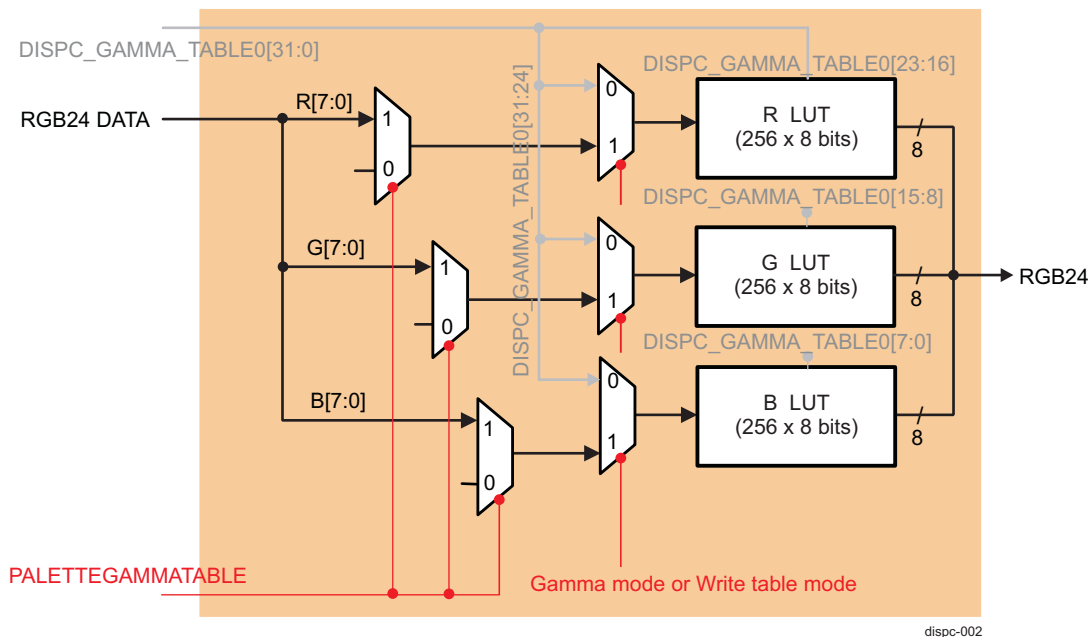

11.2.4.13.2 DISPC Gamma Correction Unit

Each LCD output supports a look up table to perform gamma correction on the display output.

[Figure 11-79](#) shows the internal architecture of the gamma table for LCD1 output.

The gamma table is split into three memories of 256 × 8-bit entries and indexed by the R/G/B component data.

Figure 11-79. DISPC LCD1 Gamma Correction Architecture

When performing gamma correction, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index 1 out of 256 × 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access).

The sequence to load the gamma table is:

1. SW writes (only writes are supported) 32-bit gamma correction values using single access, or burst access in streaming mode, into DISPC_GAMMA_TABLE0 register (for LCD1 output). The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table.
2. Loop to Step 1, if there is a new access to the gamma table register. The SW can access other registers between two accesses to the gamma table register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

For LCD1 output the usage of the gamma table is activated by setting DISPC_CONFIG1[3] PALETTEGAMMATABLE register bit to 0x1.

For LCD2 and LCD3 outputs, the associated gamma tables are enabled by setting DISPC_CONFIG1[9] GAMATABLEENABLE register bit to 0x1.

- For LCD2 output the gamma values are loaded into DISPC_GAMMA_TABLE1 register
- For LCD3 output the gamma values are loaded into DISPC_GAMMA_TABLE3 register

Figure 11-80 describes the format of one of the gamma curve values in the memory.

Figure 11-80. DISPC Data Memory Organization for Gamma Mode in LCD Output

11.2.4.13.3 DISPC Color Phase Rotation Unit

The CPR unit can be used to correct the LCD output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the DISPC_CONFIG0[15] CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in DISPC_CPRo_COEF_R
- Green 10-bit signed coefficients in DISPC_CPRo_COEF_G
- Blue 10-bit signed coefficients in DISPC_CPRo_COEF_B

The CPR can be selected for active matrix panel. The logic is integrated after the LCD overlay manager and the gamma correction, and before the spatial/temporal dithering. The CPR can be selected to correct the nonpure white backlight of the LCD module by using a programmable matrix to convert the 24-bit RGB pixel value into a new 24-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:255]. The CPR is processed by the equation shown in [Figure 11-81](#). [Table 11-112](#) lists all coefficients with their respective bit field registers for settings.

Figure 11-81. DISPC CPR Matrix

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

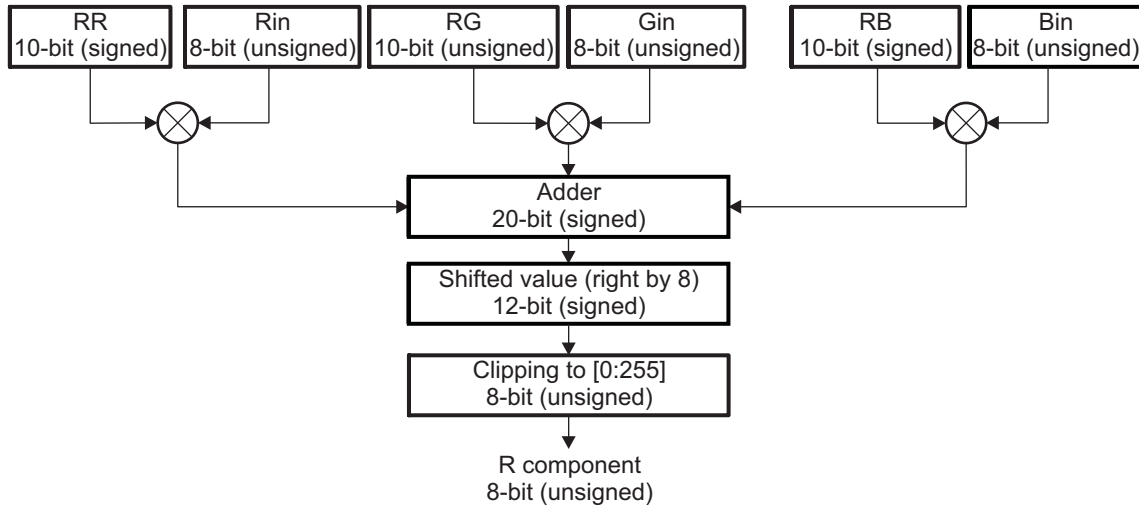

dispc-023

Table 11-112. DISPC CPR or RGB to YUV Coefficients With Associated Bit Fields

Registers	Bit Field	Color Phase Rotation	RGB to YUV
DISPC_CPRo_COEF_R	RR	Rr	Yr
	RG	Rg	Yg
	RB	Rb	Yb
DISPC_CPRo_COEF_G	GR	Gr	Cbr
	GG	Gg	Cbg
	GB	Gb	Cbb
DISPC_CPRo_COEF_B	BR	Br	Crr
	BG	Bg	Crg
	BB	Bb	Crb

Figure 11-82 shows the CPR macro-architecture.

Figure 11-82. DISPC CPR Macro-Architecture

dispc-024

NOTE: CPR is kept as 8 bit output. For the optional 10 bit BT.656-4 format, zero is simply added as 2 LSBs.

11.2.4.13.4 DISPC Color Space Conversion

The Color Phase Rotation block can be used to perform color space conversion. Table 11-112 lists the associated coefficients with their respective register bit-fields. The Color Space Conversion logic uses the CPR registers for the coefficients. The Color Space Conversion processing is enabled by setting the DISPC_CONFIG0[24] COLORCONVENABLE register bit to 0x1.

The color space conversion on the LCD output can be selected in order to convert from 24-bit RGB to YUV444. The matrix is programmed through a set of nine 10-bit signed coefficients. The result is clipped to [16:235] for the luminance and [16:240] for the chrominance, when full-range equals zero (DISPC_CONFIG0[25] FULLRANGE = 0).

Figure 11-83. DISPC RGB to YUV Registers (FullRange=0)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

If the programmed active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:255], the values Y, Cb, and Cr are clipped to the range [0:255]. The following equation gives the 11-bit coefficients of the RGB to YUV color space conversion, for full-range (DISPC_CONFIG0[25] FULLRANGE = 1)

Figure 11-84. DISPC RGB to YUV Registers (FullRange=1)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

In order to provide YUV422 data to the BT-656 or BT-1120 blocks, the YUV444 format is converted to YUV422 by sub-sampling the chrominance values. The hardware does this by averaging two-by-two the chrominance samples. The conversion from YUV444 to YUV422 is performed when the color space conversion is enabled. Thus, the output of the CPR unit is always YUV422 after color space conversion.

11.2.4.13.5 DISPC BT.656 and BT.1120 Modes

The LCD outputs (LCD1, LCD2 and LCD3) can be configured in BT.656 or BT.1120 mode. The following standards are not supported in BT.656 mode:

- BT.470 (Support for conventional Analog TV Systems)
- BT.803 (The avoidance of interference generated by digital television studio equipment)
- BT.1364 (Format of ancillary data signals carried in digital component studio interfaces)

Unsupported formats when BT.1120 mode is used:

- BT.1364 (Support for Ancillary Data during blanking period)

BT.656/BT.1120 modes use embedded EAV/SAV syncs.

CAUTION

DISPC supports maximum 256 bytes of horizontal blanking when the LCD outputs are configured in BT modes (bitfield HSW of [DISPC_TIMING_H1/2/3](#) registers is 8 bits wide). This is not compliant with BT.656 and BT.1120 standards, both of which require higher blanking periods. If more than 256 bytes of horizontal blanking are required by the application, then the RGB mode must be used for the LCD outputs.

[Figure 11-85](#) shows signal mapping on DISPC_LCD_DATA[23:0] data bus. Bits 9 to 0 are used in BT.656 mode (10-bit).

Figure 11-85. DISPC Signal Mapping in BT.656 Mode

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Unused														BT.656									

NOTE: For compatibility with existing 8-bit interfaces, the two LSB are ignored, and only bits [9:2] are used.

[Figure 11-86](#) shows signal mapping on DISPC_LCD_DATA[23:0] data bus for BT.1120 mode. Bits [19:10] (CbCr) and [9:0] (Y) are used in 20-bit mode. Bits [19:12] (CbCr) and [9:2] (Y) are used in 16-bit mode (YCbCr 4:2:2).

Figure 11-86. DISPC Signal Mapping in BT.1120 Mode

dispc-049x

NOTE: The LCD outputs support both interlace and progressive content in BT.656/BT.1120 modes.

In progressive mode the maximum resolution will be limited, as it requires two clock cycles to send out one pixel.

11.2.4.13.5.1 Blanking

During the transmission of the video signal, the portion of the stream in-between active video data segments is known as the horizontal blanking interval.

Strictly speaking this entire region is the blanking interval, but this interval also includes the EAV and SAV codes. The remaining bytes of information in a digital blanking interval are filled with values corresponding to the blanking levels of the Cb, Y and Cr signals respectively, and in accordance with the standard multiplex sequence for the stream (CbYCrY..). The blanking levels are as follows:

- Cb = 80h
- Y = 10h
- Cr = 80h.

The sequence in the BLANKING region of the data stream is therefore: 80h, 10h, 80h, 10h.....80h, 10h

For more details on setting the blanking timing values for BT.1120 and/or BT.656 mode, see [Section 11.2.4.13.8, DISPC Timing Generator and Panel Settings](#).

11.2.4.13.5.2 EAV and SAV

The End of Active Video(EAV) and Start of Active Video (SAV) parts of the stream are timing codes. Their function can be summarized as follows:

- EAV – marks the end of the active video data within the current line and therefore also the start of the subsequent line.
- SAV – heralds the start of the active video data within the current line.

These codes are embedded within the BT.656 video data stream, thereby eliminating the need for additional timing signals (HSYNC, VSYNC) to be included as part of the interface.

Both EAV and SAV codes are comprised of a sequence of four bytes (FFh – 00h – 00h - XY). The first three bytes in the sequence constitute a fixed preamble. The fourth byte, contains information about the field being transmitted (Field 1 or Field 2 in an interlaced video signal), the state of field blanking (Vertical) and the state of line blanking (Horizontal). The bit assignment for this byte of the code is shown in [Figure 11-87](#), with the function of each bit described in [Table 11-113](#).

Figure 11-87. Bit-assignment for the fourth byte of EAV/SAV codes

MSB						LSB	
1	F	V	H	P3	P2	P1	P0

Table 11-113. Bit function

Bit	Symbol	Function
7	1	Always set to '1'.
6	F	Field bit. 0 – Field 1 1 – Field 2
5	V	Vertical Blanking Status bit. This bit goes High during a vertical field blanking interval, otherwise it remains Low.
4	H	Horizontal Blanking Status bit. 0 – byte is part of SAV code (i.e. stream is entering an active video data region for the current line) 1 – byte is part of EAV code (i.e. stream has entered a horizontal blanking interval - start of a new line)
3	P3	Protection bit 3
2	P2	Protection bit 2
1	P1	Protection bit 1
0	P0	Protection bit 0

The protection bits allow for detection and correction of 1-bit errors and the detection of 2-bit errors. The status of P3, P2, P1 and P0 depend on the states of bits F, V and H. This dependency is shown in [Table 11-114](#).

Table 11-114. Status of protection bits as F, V and H vary

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

Enabling BT.656 or BT.1120 format is done by setting:

- [DISPC_CONFIG1\[20\]](#) BT656ENABLE or [DISPC_CONFIG1\[21\]](#)BT1120ENABLE registers for LCD1 output
- [DISPC_CONFIG2\[20\]](#) BT656ENABLE or [DISPC_CONFIG2\[21\]](#)BT1120ENABLE registers for LCD2 output
- [DISPC_CONFIG3\[20\]](#) BT656ENABLE or [DISPC_CONFIG3\[21\]](#)BT1120ENABLE registers for LCD3 output

NOTE: It is not possible to enable BT.656 and BT.1120 mode simultaneously on the same LCD output

11.2.4.13.6 DISPC Active Matrix

Depending on the color depth, the active matrix output:

- 24 bpp supports 16,777,216 colors.
- 18 bpp supports 262,144 colors.
- 16 bpp supports 65,536 colors.
- 12 bpp supports 4096 colors.

When in active matrix path configuration, after setting the [DISPC_CONTROLo\[3\]](#) STNTFT bit to 0x1, two submodules must be configured:

- Spatial/temporal dithering
- Multiple cycle output format (TDM)

11.2.4.13.6.1 DISPC Spatial/Temporal Dithering

When the active matrix path is used, the spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the LCD panel. The dithering logic is integrated after the CPR and before the TDM. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the DISPC_CONTROLo[31:30]

SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied, and in multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the DISPC_CONTROLo[7] STDITHERENABLE bit to 0x1.

NOTE: When the spatial/temporal dithering logic is disabled (see also [Table 11-115](#)):

- If the interface data bus is smaller than the pixel format size, then the MSBs of the pixel color components are output on the interface data bus.
- If the interface data bus is larger than the pixel format size, then by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus (when replication is enabled), or the LSB is filled with 0s (when replication is disabled). The pixel components replication is performed in the associated pipeline, as described in [Section 11.2.4.9.1](#) and [Section 11.2.4.10.1](#), *DISPC Replication Logic*.

Table 11-115. DISPC LCD Data Output (Spatial/Temporal Dithering Disabled)

NOTE: LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.2.4.13.6.2 DISPC Multiple Cycle Output Format (TDM)

When the TDM is enabled (DISPC_CONTROLo[20] TDMENABLE = 1), after the active matrix display processing, the pixels are formatted on one or multiple cycles (a maximum of three cycles). The number of bits for each cycle is set in the DISPC_DATAo_CYCLE1 register for the first cycle, the DISPC_DATAo_CYCLE2 register for the second cycle, and the DISPC_DATAo_CYCLE3 register for the third cycle. The interface data bus width can be 8, 9, 12, or 16 bits. The configuration of the data bus is done in the DISPC_CONTROLo[22:21] TDMPARALLELMODE bit field.

When the TDM is disabled (DISPC_CONTROLo[20] TDMENABLE = 0), the DISPC outputs the pixels using the conventional formats: active matrix display monochrome/color. In this case, the configuration of the data bus width is done through the DISPC_CONTROLo[9:8] TFTDATALINES bit field.

Figure 11-88 through Figure 11-91 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

11.2.4.13.7 DISPC Synchronized Buffer Update

A synchronization mismatch between the frame buffer and the display refreshes, named tearing effect, can lead to images that appear to be stretched on the screen. To avoid it, a synchronization mechanism is used between the DISPC and the process that updates the buffer. An interrupt is generated when the display reaches a predefined line number. The PROGRAMMEDLINENUMBER_IRQ interrupt ([DISPC_IRQSTATUS](#) and [DISPC_IRQENABLE](#)) is a level signal and stays active during the programmed line of the display.

11.2.4.13.8 DISPC Timing Generator and Panel Settings

When Active Matrix Display is used the following registers must be set:

The size of and panel is defined by:

- Number of lines, DISPC_SIZE_LCD0[27:16] LPP bit field, with a value from 1 to 4096
- Number of pixels per line, DISPC_SIZE_LCD0[11:0]PPL bit field, with a value from 1 to 4096

Standard HSYNC/VSYNC timing generation are programmable for each LCD outputs independently:

- Horizontal front porch is set in the DISPC_TIMING_Ho[19:8] HFP bit field.
- Horizontal back porch is set in the DISPC_TIMING_Ho[31:20] HBP bit field.
- Horizontal synchronization pulse width is set in the DISPC_TIMING_Ho[7:0] HSW bit field.
- Vertical front porch is set in the DISPC_TIMING_Vo[19:8] VFP bit field.
- Vertical back porch is set in the DISPC_TIMING_Vo[31:20] VBP bit field.
- Vertical synchronization pulse width is set in the DISPC_TIMING_Vo[7:0] VSW bit field.

When the output is in BT.1120 or BT.656 mode, the following timing constant are mapped onto the DISPC_TIMING_Ho and DISPC_TIMING_Vo registers:

- Progressive mode:
 - Horizontal blanking is set in the DISPC_TIMING_Ho[7:0] HSW bit field
 - Vertical frame blanking No 1 is set in the DISPC_TIMING_Vo[19:8] VFPbit field.
 - Vertical frame blanking No 2 is set in the DISPC_TIMING_Vo[31:20] VBPbit field.
 - Number of lines is set in the [DISPC_SIZE_LCD1\[27:16\]](#) LPP bit field
 - Number of pixels per line is set in the [DISPC_SIZE_LCD1\[11:0\]](#) PPL bit field.
- Interlaced mode:
 - Horizontal blanking is set in the DISPC_TIMING_Ho[7:0] HSW bit field.
 - Vertical field blanking No 1 for Even Field is set in the DISPC_TIMING_Ho[19:8] HFP bit field.
 - Vertical field blanking No 2 for Even Field is set in the DISPC_TIMING_Ho[31:20] HBP bit field.
 - Vertical field blanking No 1 for Odd Field is set in the DISPC_TIMING_Vo[19:8] VFP bit field.
 - Vertical field blanking No 2 for Odd Field is set in the DISPC_TIMING_Vo[31:20] VBP bit field.
 - Number of lines per field (even) is set in the [DISPC_SIZE_LCD1\[27:16\]](#) LPP bit field.
 - Delta number of odd field compared to even field (in a single line) is set in the [DISPC_SIZE_LCD1\[15:14\]](#) DELTA bit field.
 - Number of pixels per line is set in the [DISPC_SIZE_LCD1\[11:0\]](#) PPL bit field.

Horizontal/vertical synchronization and ACBIAS signals polarity are programmable by setting the DISPC_POL_FREQo[12] IVS, DISPC_POL_FREQo[13] IHS, and DISPC_POL_FREQo[15] IEO bits. These signals can be gated by setting the DISPC_CONFIGo[7] VSYNCGATED and DISPC_CONFIGo[6] HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the IPC bit of DISPC_POL_FREQo[14] IPC and CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC (the values must mach) registers. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the DISPC_POL_FREQo[16] RF and CTRL_CORE_SMA_SW_1[] DSS_CHx_RF bit.

[Table 11-116](#) describes the programming rules for LCD timing.

Table 11-116. DISPC Programming Rules

	No Downsampling	Downsampling H or V	Downsampling H + V
$(HBP + HSW + HFP) \times PCD$	>8	>10	>20

Figure 11-92 shows the timing values description in the case of an active matrix display.

Figure 11-92. DISPC Timing Values (Active Matrix Display)

dispc-031

The 8-bit pixel clock divider (the `DISPC_DIVISOR0[7:0]` PCD bit field) selects the pixel clock frequency. This bit field generates a range of pixel clock frequencies from LC/2 to LC/256, where LC is the logic clock from the divided functional clock of the DISPC by the `DISPC_DIVISOR23:16` LCD bit field.

The pixel clock is defined by the following equation:

$$\text{Pixel Clock} = (\text{FunctionalClock}/\text{LCD}[7:0])/\text{PCD}[7:0]$$

The pixel clock can be gated by setting the `DISPC_CONFIG0[5]` `PIXELCLOCKGATED` bit to 0x1.

The LCD output can be configured in progressive output or interlace output. The selection is done by writing into the `DISPC_CONFIG0[22]` `OUTPUTMODEENABLE` bit. The reset value is 0x0, which means progressive mode. When progressive mode is selected, the FID signal associated to the LCD output is driven low (INACTIVE state). The selection can be changed only if the corresponding LCD output is disabled. The configuration is independent for each LCD output.

When in interlaced mode, the `DISPC_CONFIG0[23]` `FIDFIRST` bit indicates which field is output first:

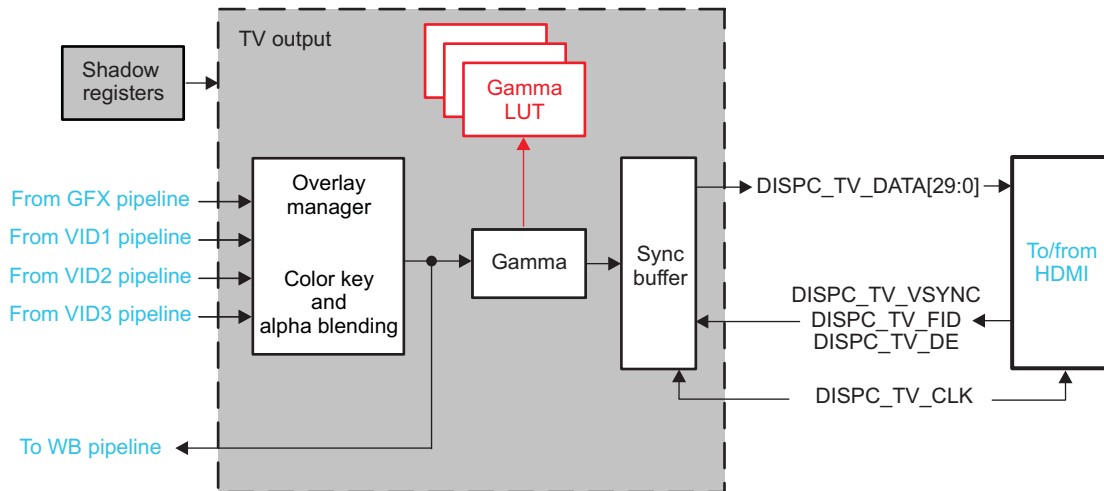

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

11.2.4.14 DISPC TV Output

The TV output paths consist of several processing blocks (see Figure 11-93):

- Overlay manager
- Gamma correction unit
- Synchronization buffer

Figure 11-93. DISPC TV Output Architecture

dispc-029

The TV output is connected to the HDMI. In analog output or HDMI, the DISPC TV output receives an external clock, DISPC_TV_CLK, and based on the VSYNC generated by the HDMI, hold time, vertical offset, and horizontal offset, outputs the pixels synchronously. The size of the field/frame to output defines the number of pixels to output on each line and the number of lines for each field/frame.

11.2.4.14.1 DISPC Overlay Manager

The overlay mechanism is identical in LCD1, LCD2, and LCD3 (see Section 11.2.4.13.1, *Overlay Manager*).

11.2.4.14.2 DISPC Gamma Correction Unit

The gamma correction unit works as described in Section 11.2.4.13.2, *Gamma Correction Unit*. The only difference is in the input pixel format RGB30. Each component of encoded pixel value is used as a pointer to index 1 out of 1024 × 30-bit gamma curve entries in the table. Each 10-bit component is replaced with the 10-bit table value corresponding to R, G, or B component. The table is loaded by software, through the DISPC_GAMMA_TABLE2 register, and enabled via DISPC_CONFIG1[9] GAMATABLEENABLE register bit. It is possible to load only part of the table. For each write access to the table, the 30-bit gamma value is associated with bit [31] INDEX to indicate that a new table is defined. Setting bit [31] INDEX to 0x1 for the first time, resets the internal index counter. All the following accesses are considered to be for incremented index addressing in the table (bit [31] INDEX is set to 0 for each subsequent access). Figure 11-94 shows the format of one of the gamma curve values in the memory.

Figure 11-94. DISPC Data Memory Organization for Gamma Mode in TV Output

dispc-084

11.2.4.14.3 DISPC Synchronized Buffer Update

The synchronized buffer update is identical in LCD1, LCD2, and LCD3 (see Section 11.2.4.13.7, *Synchronized Buffer Update*).

11.2.4.14.4 DISPC Timing and TV Format Settings

Figure 11-95 shows the TV formats supported.

Figure 11-95. DISPC Example Timing TV Formats

The size of a TV output format is defined by:

- Number of lines, [DISPC_SIZE_TV\[27:16\]](#) LPP bit field, with a value from 1 to 4096
- Number of pixels per line, [DISPC_SIZE_TV\[11:0\]](#) PPL bit field, with a value from 1 to 4096
- Delta size between odd/even field, [DISPC_SIZE_TV\[15:14\]](#) DELTA_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC_CONTROL1\[19:17\]](#) HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to the HDMI encoder, [Table 11-117](#) indicates the [DISPC_SIZE_TV](#) (PPL and LPP) value for each HD standard.

Table 11-117. DISPC PPL and LLP Value for HD Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
HDTV	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF 04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..frames/s)	0x021B 07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x0437 07FF
	720p 3D (frame packing)	1280	1470	148.5/148.35/148.5 MHz (60/59.94/50 frames/s)	0x05BD 04FF
	1080p 3D (frame packing)	1920	2205	148.5/148.35 MHz (24/23.98 frames/s)	0x089C 07FF
	1080p 3D (side-by-side half)	1920	1080	148.5 MHz (60 frames/s)	0x0437 07FF

-
- NOTE:** When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:
- As defined by the *HDMI v1.4a Specification*, Section 8.2.3.2, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
 - The stereoscopic pictures can be processed through the three video pipelines (VID1, VID2, or VID3). For more information about the configuration of video pipelines, see [Section 11.2.4.10, Video Pipelines](#).
 - The 3D frame is generated by setting the TV overlay manager to combine the outputs of the selected video pipelines that hold the pictures. One video pipeline (VID1 or VID3) must carry the top field of the 3D frame (left stereoscopic picture), and the other video (VID2) pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area. For more information, see the *HDMI v1.4a Specification*, Section 8.2.3.2.
 - The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [27:16] SIZEY and [10:0] SIZEX bit fields of the DISPC_VIDp_SIZE register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the DISPC_VIDp_POSITION register. The active space area of the 3D frame can be encoded by setting the solid background color for the TV output (the DISPC_DEFAULT_COLOR1[23:0] DEFAULTCOLOR bit field). For more information about the overlay mechanism, see [Section 11.2.4.14.1, DISPC Overlay Manager](#).
-

11.2.4.15 DISPC Frame Width Considerations

DISPC provides three sets of configuration registers to control the maximum frame size in different stages of its internal pipelines (see [Figure 11-96, DISPC Frame Width Control](#)):

- DISPC_VID#_PICTURE_SIZE registers: MEMSIZEX and MEMSIZEY bit-fields define the number of pixels and lines to fetch from memory (via DISPC DMA engine).
- DISPC_GFX/VID#_SIZE registers: SIZEX and SIZEY bit-fields define the size of the output frame from each processing pipeline to LCD/TV overlay manager for blending.
- DISPC_SIZE_TV/LCD# registers: LPP and PPL bit-fields define the final display panel output resolution.

Figure 11-96. DISPC Frame Width Control

The MEMSIZEX and SIZEX bit-fields are 11-bit, meaning the maximum horizontal frame size allowed is 2048 pixels. This parameter determines the maximum source frame (including the input to the scalers) that can be displayed.

The MEMSIZEY and SIZEY bit-fields are 12-bit, meaning the maximum vertical size allowed is 4096 lines.

The LPP and PPL bit-fields are also 12-bit, which means that starting at the LCD/TV overlay manager and including the output to the display panel, the frame size can be up to 4096x4096 as long as the pixel clock constraints are met.

Implication: The output to display panel can be as large as 4096 x 4096 (4K x 4K), although the actual size of the output frame would be smaller due to the maximum pixel clock limitation. However, the maximum source frame that can be read from memory by a single GFX/VID pipeline can be 2048 x 4096 (2K x 4K) only. Therefore, to display a source frame with width > 2048 pixels, two layers must be used and corresponding pipeline outputs must be merged in the overlay manager before being sent out to the display panel.

Refer to device Data Manual for details on the maximum supported pixel clock (VOUTx_CLK) or HDMI supported frame rates.

11.2.4.16 DISPC Extended 3D Support

The DISPC supports several formats to support 3D displays. The following three sections provide further details.

11.2.4.16.1 DISPC Extended 3D Support - Line Alternative Format

Line alternative format is defined by the HDMI Specification 1.4a. In general the functionality is:

- Lines from the left and the right frames are interleaved alternatively on the screen to produce a 3D image.
- Required also to support interleaving column-wise to support all possible screen orientations.

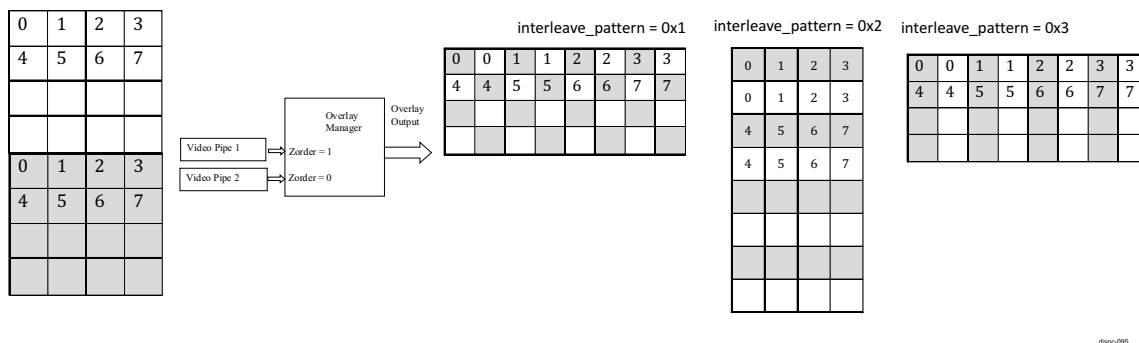

The functionality is done in the overlay manager:

- The layers are grouped into two categories based on the z-order: Odd z-order may blend together and will interleave with even z-order pipes, which may blend together.
- Two types of interleaves are possible, line-based interleaving and pixel-based interleaving to support landscape and portrait screen orientations.

The configuration is done from the DISPC_CONFIG1[29:28] TVINTERLEAVE for the TV output, DISPC_CONFIG1[27:26] PLCDINTERLEAVE for the primary LCD, DISPC_CONFIG2[27:26] SLCDINTERLEAVE for the secondary LCD, and DISPC_CONFIG3[27:26] TLCDINTERLEAVE for the third LCD. The following values apply for the these bitfields:

- 0x0: If zero then no interleaving happens in the overlay manager.
- 0x1: Checkerboard pattern:
 - All even pixels on even lines have a contribution from even z-order pipes.
 - All odd pixels on even lines have a contribution from odd z-order pipes.
 - All even pixels on odd lines have a contribution from odd z-order pipes.
 - All odd pixels on odd lines have a contribution from even z-order pipes.
- 0x2: All even lines (all pixels) have a contribution from even z-order pipes. All odd lines (all pixels) have a contribution from the odd z-order pipes.
- 0x3: All even pixels (for all lines) have a contribution from even z-order pipes. All odd pixels (for all lines) have a contribution from the odd z-order pipes.

Figure 11-97. DISPC Illustration of 3D Interleaving

Moreover, from Figure 11-97 above, if interleave_pattern is programmed as 0x2, in this case the entire screen composited by the overlay manager (PPL x LPP) gets sub-divided into odd and even lines. It is possible for a 3D window created using the two pipes to have a non-zero position (that is, POSX and POSY not equal to zero).

In such cases depending on the oddness or evenness of the POSY setting, the first line in the window may come from Video Pipe 1 or Video Pipe 2.

For instance, if the POSX = 3, POSY = 3 (set in DISPC_GFX_POSITION, DISPC_VID1_POSITION, DISPC_VID2_POSITION, DISPC_VID3_POSITION registers), then the final composited screen with PPL = 8, LPP = 12 may look like below:

Figure 11-98. DISPC Illustration of a Non-zero Position of 3D Window

NOTE: In this case the first line comes from the odd z-order pipeline, that is Video Pipe 1.

The following limitations apply to the 3D Line alternative format:

- Software must ensure that the left/right frames are of same size.
- Software must ensure that in case of line interleaving the SIZEY is not greater than LPP/2.
- Software must ensure that in case of pixel interleaving the SIZEX is not greater than PPL/2.
- Software must program POSX and POSY for both left and right frame to be the same.
- Color-keying is not available for 3D formats.
- Since each overlay manager can support 4k x 4k frames, max resolution of each left/right frame will be restricted to 2k x 2k.

11.2.4.16.2 DISPC Extended 3D Support - Frame Packing Format Format

In this mode the pipe fetches two windows (of SIZEX x SIZEY) during a complete panel frame (PPL x LPP). The mode is enabled from [DISPC_GFX_ATTRIBUTES\[10\] FRAMEPACKINGMODE](#) and [DISPC_VID1_ATTRIBUTES\[8\]](#), [DISPC_VID2_ATTRIBUTES\[8\]](#), [DISPC_VID3_ATTRIBUTES\[8\]](#) [FRAMEPACKINGMODE](#)

The position for the first window is set in [DISPC_GFX_POSITION](#), [DISPC_VID1_POSITION](#), [DISPC_VID2_POSITION](#), [DISPC_VID3_POSITION](#), while the position for the second window is set in [DISPC_GFX_POSITION2](#), [DISPC_VID1_POSITION2](#), [DISPC_VID2_POSITION2](#), [DISPC_VID3_POSITION2](#)

When it is detected that a pipe has finished sending the programmed number of lines to the overlay or Write-back pipe, a reset is generated for the pipe as well as the DMA channel associated with the pipe. At the same instant, the base address configuration for the DMA channel is changed from the BA0 to the BA1.

Due to the reset the pipe and DMA starts fetching the data from BA1. At the end of the processing of BA1 data, the DMA channel and the pipe become idle and clock gated.

The overlay manager composes the final frame to be sent to the panel and uses the (POSX, POSY) coordinates for the first window and (POSX2, POSY2) for the second window.

The following limitations apply to the 3D Frame Packing format:

- Only frame packing for progressive mode is supported. Frame packing of interlaced formats is not supported.
- End-of-window interrupts will be generated twice per outgoing-frame.
- Flip Immediate will not work as expected.
- It is software responsibility to calculate and program the (POSX2, POSY2) as per the active space

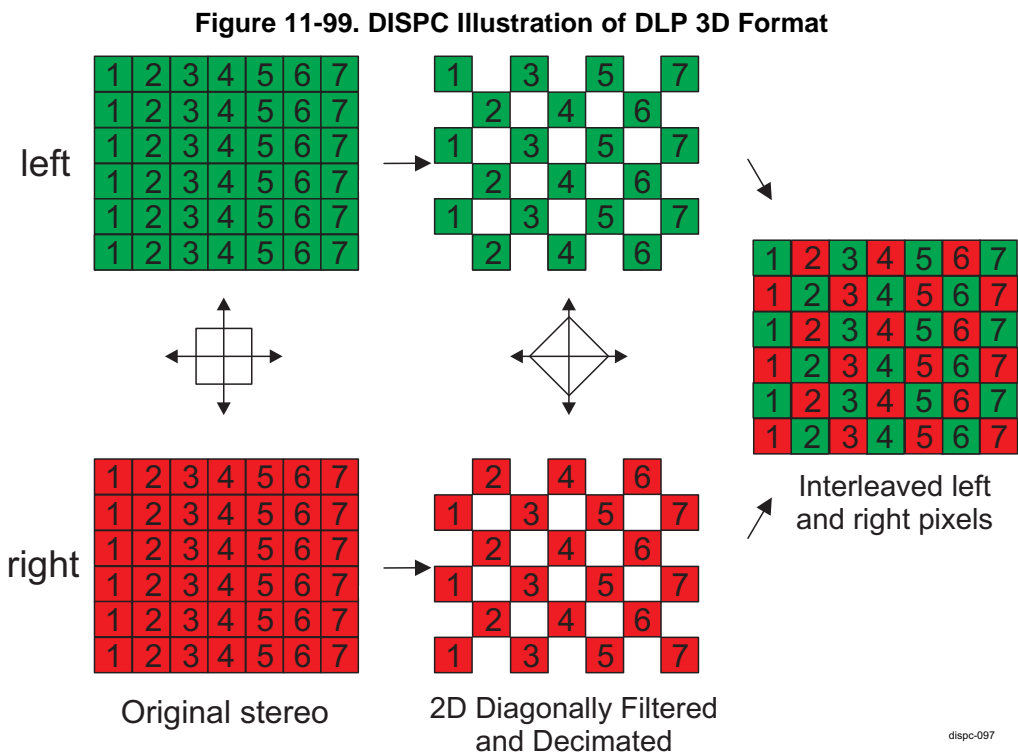

required by the panel.

11.2.4.16.3 DISPC Extended 3D Support - DLP 3D Format

The DLP 3D format sub-samples the left and right frames across the diagonal before interleaving the frames in a checker-board fashion.

The sub-sampling required on the left and the right frame is complementary. This sampling pattern is also defined in the HDMI 3D Specification 1.4a as two Quincunx matrices. The format is configured from `DISPC_GFX_ATTRIBUTES[20:18] SUBSAMPLINGPATTERN`, `DISPC_VID1_ATTRIBUTES2[11:9]`, `DISPC_VID2_ATTRIBUTES2[11:9]`, `DISPC_VID3_ATTRIBUTES2[11:9] SUBSAMPLINGPATTERN` with the following possible configuration values:

- 0x0: All pixels from the pipes are used. No sub-sampling.
- 0x1: Quincunx Matrix Odd-position sub-sampling is used.
- 0x2: Quincunx Matrix Even-position sub-sampling is used.
- 0x3 to 0x7: Reserved

The following limitations apply to the DLP 3D Format :

- Even z-order pipes can have only sub-sampling = 0x1.
- Odd z-order pipes can only have sub-sampling = 0x2.

11.2.4.17 DISPC Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers let software change the values of the registers at any time. When all the registers for a given configuration are into the registers, software must set 1 bit only to validate the configuration. When hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

NOTE: As a general rule, all shadow registers are updated with the value of their shadows when:

- The interface is enabled.
- The GO bit field of the pipeline, with which the register is associated, is set and the output sync is active.

The bits enabling the hardware to use the new configuration are:

- **DISPC_CONTROL1**[5] GOLCD bit for all the registers associated to the LCD1 output, and for all registers of WB and DMA, if the LCD1 channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC_WB_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC_WB_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- **DISPC_CONTROL1**[6] GOTV bit for all the registers associated to the TV output, and for all registers of WB and DMA, if the TV channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC_WB_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC_WB_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the external EVSYNC.
- **DISPC_CONTROL2**[5] GOLCD bit for all the registers associated to the LCD2 output, and for all registers of WB and DMA, if the LCD2 channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC_WB_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC_WB_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- **DISPC_CONTROL3**[5] GOLCD bit for all the registers associated to the LCD3 output, and for all registers of WB and DMA, if the LCD3 channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC_WB_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC_WB_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- **DISPC_WB_ATTRIBUTES**[0] ENABLE bit for all the registers associated to the WB, if the transfer memory-to-memory is not associated with a channel out.
- The **DISPC_CONTROL2**[6] GOWB bit and the [5] GOLCD and [6] GOTV bits in the **DISPC_CONTROL1/DISPC_CONTROL2** registers, combined with the synchronization event of the channel output selected for write back. This applies to all registers associated with the selected channel out and further delayed by the setting in the **DISPC_WB_ATTRIBUTES2**[7:0] WBDELAYCOUNT bit field, for all registers of the write back and DMA. The GOWB bit is required to be set only in WB capture mode; it is not required when WB memory-to-memory mode is used.

NOTE: Before setting the GOLCD, GOTV, or GOWB bits, the user must ensure that the bits are cleared. The hardware resets the bits when the update completes.

Table 11-118 lists the shadow registers. Registers that do not have a mark in any column are not shadowed.

11.2.5 DISPC Programming Guide

11.2.5.1 DISPC Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

11.2.5.1.1 DISPC Global Initialization

11.2.5.1.1.1 DISPC Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DISPC module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DISPC. For more information, see [Section 11.1.2, DISPC Integration](#), and [Section 11.1.1, DISPC Environment](#).

Table 11-119. DISPC Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See Section 3.1.1.1.2, Module-Level Clock Management , in Chapter 3, Power, Reset, and Clock Management .
Control module	Module-specific pad muxing and configuration must be set in the control module. See Section 18.4.6.1.1, Pad Configuration Registers , in Chapter 18, Control Module .
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 17, Interrupt Controllers .
Interconnect	For more information about interconnect configuration, see Section 14.2, L3 Interconnect .
DMA_CROSSBAR	DMA_CROSSBAR configuration must be done to allow module DREQs to be mapped to certain device DMA line. For more information see Section 18.4.6.5, DMA_CROSSBAR Module Functional Description , in Chapter 18, Control Module .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 18, Control Module .

11.2.5.1.2 DISPC Operational Modes Configuration

[Table 11-120](#) lists the steps to configure the operational modes in the DISPC.

Table 11-120. DISPC Configuration

Step	Register/Bit Field/Programming Model
For a GFX pipeline configuration	
Configure the GFX DMA channel.	See Table 11-121 .
Configure the GFX pipeline.	See Table 11-124 .
Configure the LCD or TV output.	For LCD output, see Table 11-141 . For TV output, see Table 11-150 .
For a Video pipeline configuration	
Configure the video DMA channel.	See Table 11-122 .
Configure the video pipeline.	See Table 11-128 .
Configure the LCD or TV output.	For LCD output, see Table 11-141 . For TV output, see Table 11-150 .
For a WB pipeline configuration	
Configure the WB DMA channel.	See Table 11-123 .
Configure the WB pipeline.	For video pipelines, see Table 11-136 .

11.2.5.1.2.1 DISPC DMA Configuration

11.2.5.1.2.1.1 DISPC Main Sequence – DISPC DMA Channel Configuration

This procedure describes the parameters of the GFX, video, and WB DMA channel parameters (see [Table 11-121](#) through [Table 11-123](#), respectively).

Table 11-121. DISPC Configure the GFX DMA Channel

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format according to memory access type, rotation, mirroring (see Section 11.2.4.6, DISPC DMA Engine).	DISPC_GFX_BA_j[31:0] BA	0x—
Set the rotation flag.	DISPC_GFX_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row.	DISPC_GFX_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels.	DISPC_GFX_PIXEL_INC[7:0] PIXELINC	0x—
Determine the FIFO preload mode.	DISPC_GFX_ATTRIBUTES[11] BUFPRELOAD	0x—
Set the preload value.	DISPC_GFX_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type.	DISPC_GFX_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size.	DISPC_GFX_ATTRIBUTES[7:6] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold.	DISPC_GFX_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold.	DISPC_GFX_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable self-refresh.	DISPC_GFX_ATTRIBUTES[24] SELFREFRESH	0x—
Select priority over the other pipeline.	DISPC_GFX_ATTRIBUTES[23] ARBITRATION	0x—

Table 11-122. DISPC Configure the Video DMA Channel

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (see Section 11.2.4.6, DISPC DMA Engine).	DISPC_VIDp_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (see Section 11.2.4.6, DISPC DMA Engine) ⁽¹⁾ .	DISPC_VIDp_BA_UV_j[31:0] BA	0x—
Set the rotation flag.	DISPC_VIDp_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row.	DISPC_VIDp_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels.	DISPC_VIDp_PIXEL_INC[7:0] PIXELINC	0x—
Set the X original image size.	DISPC_VIDp_PICTURE_SIZE[10:0] MEMSIZE_X	0x—
Set the Y original image size.	DISPC_VIDp_PICTURE_SIZE[27:16] MEMSIZE_Y	0x—
Determine the FIFO preload mode.	DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD	0x—
Set the preload value.	DISPC_VIDp_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type.	DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size.	DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold.	DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold.	DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable self-refresh.	DISPC_VIDp_ATTRIBUTES[24] SELFREFRESH	0x—

⁽¹⁾ Applicable only for YUV pixel format

Table 11-122. DISPC Configure the Video DMA Channel (continued)

Step	Register/Bit Field/Programming Model	Value
Select priority over the other pipeline.	DISPC_VIDp_ATTRIBUTES[23] ARBITRATION	0x–

Table 11-123. DISPC Configure the WB DMA Channel

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (see Section 11.2.4.6 , <i>DISPC DMA Engine</i>).	DISPC_WB_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (see Section 11.2.4.6 , <i>DISPC DMA Engine</i>) ⁽¹⁾ .	DISPC_WB_BA_UV_j[31:0] BA	0x—
Set the stride of CbCr component ⁽²⁾ .	DISPC_WB_ATTRIBUTES[22] DOUBLESTRIDE	0x–
Set the rotation flag.	DISPC_WB_ATTRIBUTES[13:12] ROTATION	0x–
Set the number of bytes to increment at the end of the row.	DISPC_WB_ROW_INC[31:0] ROWINC ⁽³⁾	0x–
Set the number of bytes to increment between two pixels.	DISPC_WB_PIXEL_INC[7:0] PIXELINC	0x–
Set the X final image size in system memory.	DISPC_WB_PICTURE_SIZE[10:0] ORGSIZE_X	0x–
Set the Y final image size in system memory.	DISPC_WB_PICTURE_SIZE[27:16] ORGSIZE_Y	0x–
Set the burst size.	DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE	0x–
Set the high level of DMA FIFO threshold.	DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x–
Set the low level of DMA FIFO threshold.	DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x–
Select priority over the other pipeline.	DISPC_WB_ATTRIBUTES[23] ARBITRATION	0x–

⁽¹⁾ Applicable only for YUV pixel format

⁽²⁾ Applicable only for YUV pixel format.

⁽³⁾ The [DISPC_WB_ROW_INC](#) register can be used only in 2D mode (using the Tiler). In order to use the [DISPC_WB_ROW_INC](#) register, the [DISPC_WB_ATTRIBUTES\[8\] BURSTTYPE](#) bit must be set to 1.

11.2.5.1.2.2 DISPC GFX Pipeline Configuration

11.2.5.1.2.2.1 DISPC Main Sequence – Configure the GFX Pipeline

This procedure details the steps for a GFX pipeline configuration (see [Table 11-124](#)).

Table 11-124. DISPC Configure the GFX Pipeline

Step	Register/Bit Field/Programming Model	Value
Configure the GFX window.	See Table 11-125 .	
Configure the GFX pipeline processing.	See Table 11-126 .	
Configure the GFX pipeline layer output.	See Table 11-127 .	
Validate the GFX configuration according to outputs associated to the pipeline.	DISPC_CONTROL1 [5] GOLCD	
	DISPC_CONTROL2 [5] GOLCD	
	DISPC_CONTROL2 [6] GOWB	
	DISPC_CONTROL1 [6] GOTV	
Enable the GFX pipeline.	DISPC_GFX_ATTRIBUTES [0] ENABLE	0x1

11.2.5.1.2.2.2 DISPC Subsequence – Configure the GFX Window

This subsequence describes the parameters of the image to be displayed on the LCD panel (see [Table 11-125](#)).

Table 11-125. DISPC Configure the GFX Window

Step	Register/Bit Field/Programming Model	Value
Select the format of image.	DISPC_GFX_ATTRIBUTES [4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel.	DISPC_GFX_SIZE [10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel.	DISPC_GFX_SIZE [27:16] SIZEY	0x–
Set the X position of image in respect to LCD panel.	DISPC_GFX_POSITION [10:0] POSX	0x–
Set the Y position of image in respect to LCD panel.	DISPC_GFX_POSITION [26:16] POSY	0x–

11.2.5.1.2.2.3 DISPC Subsequence – Configure the GFX Pipeline Processing

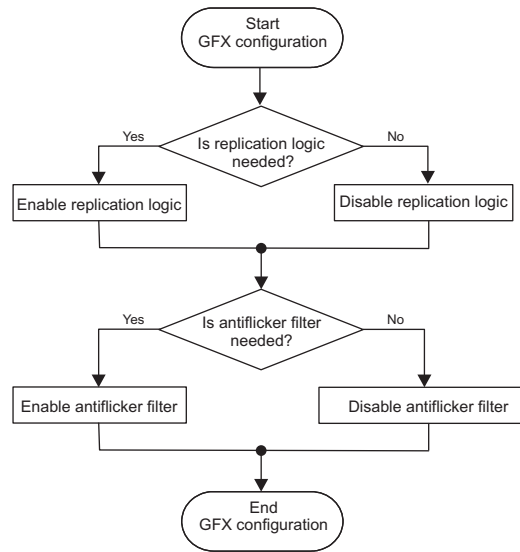

This subsequence describes the steps to configure the GFX pipeline processing in the DISPC (see [Table 11-126](#)).

Table 11-126. DISPC Configure the GFX Pipeline Processing

Step	Register/Bit Field/Programming Model	Value
Enable replication logic.	DISPC_GFX_ATTRIBUTES [5] REPLICATIONENABLE	0x1
Enable antiflicker filter.	DISPC_GFX_ATTRIBUTES [24] ANTIFLICKER	0x1

Figure 11-100 shows the configuration of the DISPC graphics pipeline processing.

Figure 11-100. DISPC GFX Pipeline Processing Configuration

dispc-091

11.2.5.1.2.2.4 DISPC Subsequence – Configure the GFX Pipeline Layer Output

This subsequence describes the video layer settings available at the pipeline level necessary when using the overlay manager (see Table 11-127).

Table 11-127. DISPC Configure the GFX Pipeline Layer Output

Step	Register/Bit Field/Programming Model	Value
Set the LCD/TV output.	DISPC_GFX_ATTRIBUTES[8] CHANNELOUT	0x–
If DISPC_GFX_ATTRIBUTES[8] = 0, set the LCD output.	DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager.	DISPC_GFX_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order.	DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the alpha blender unit.	DISPC_GLOBAL_ALPHA[7:0] GFXGLOBALALPHA	0x–

11.2.5.1.2.3 DISPC Video Pipeline Configuration

11.2.5.1.2.3.1 DISPC Main Sequence – Configure the Video Pipeline

This sequence describes the steps to configure the video pipeline (see Table 11-128).

Table 11-128. DISPC Configure the Video Pipeline

Step	Register/Bit Field/Programming Model	Value
Configure the video window.	See Table 11-129.	
Configure the video pipeline processing.	See Table 11-130.	
Configure the video pipeline layer output.	See Table 11-135.	
Validate the video configuration according to outputs associated to the pipeline.	DISPC_CONTROL1[5] GOLCD	
	DISPC_CONTROL2[5] GOLCD	
	DISPC_CONTROL2[6] GOWB	
	DISPC_CONTROL1[6] GOTV	

Table 11-128. DISPC Configure the Video Pipeline (continued)

Step	Register/Bit Field/Programming Model	Value
Enable video pipeline.	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1

11.2.5.1.2.3.2 DISPC Subsequence – Configure the Video Window

This subsequence describes the parameters of the image to be displayed on the LCD panel (see [Table 11-129](#)).

Table 11-129. DISPC Configure the Video Window

Step	Register/Bit Field/Programming Model	Value
Select the format of image.	DISPC_VIDp_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel.	DISPC_VIDp_SIZE[10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel.	DISPC_VIDp_SIZE[27:16] SIZEY	0x–
Set the X position of image in respect to LCD panel.	DISPC_VIDp_POSITION[10:0] POSX	0x–
Set the Y position of image in respect to LCD panel.	DISPC_VIDp_POSITION[26:16] POSY	0x–

11.2.5.1.2.3.3 DISPC Subsequence – Configure the Video Pipeline Processing

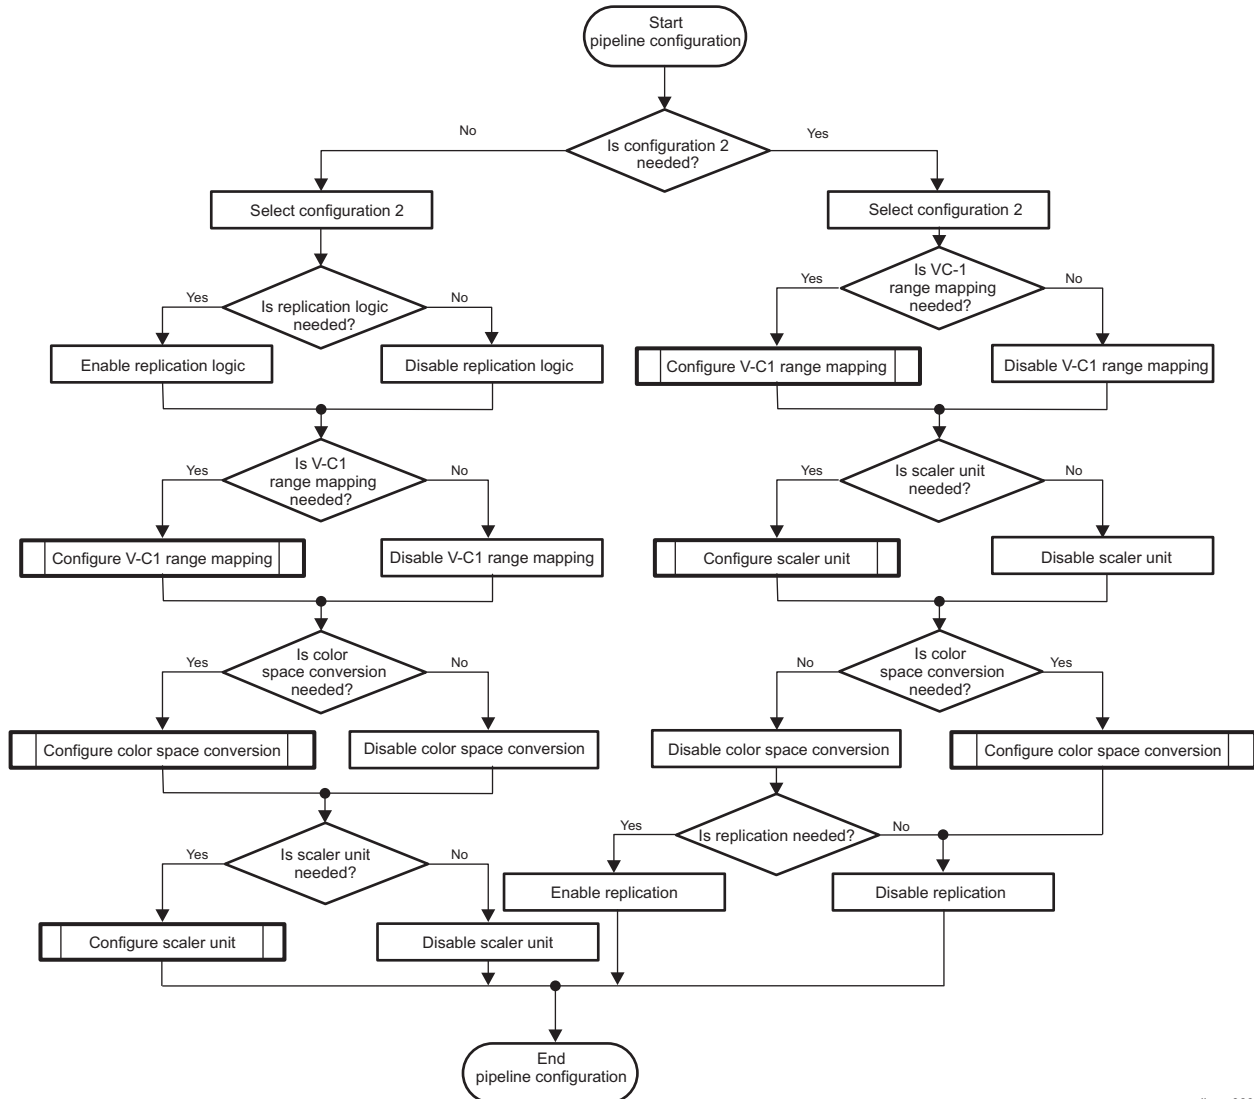

This subsequence describes the steps to configure video pipeline processing (see [Table 11-130](#) and [Figure 11-101](#)).

Table 11-130. DISPC Configure the Video Pipeline Processing

Step	Register/Bit Field/Programming Model	Value
Select the video pipeline configuration 1 or 2.	DISPC_VIDp_ATTRIBUTES2[8] YUVCHROMARESAMPLING	0x–
Enable/disable replication logic ⁽¹⁾ .	DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE	0x1
Configure the VC-1 range mapping ⁽¹⁾ .	See Section 11.2.5.1.2.3.4 .	
Configure the video color space conversion ⁽¹⁾ .	See Section 11.2.5.1.2.3.5 .	
Configure the video scaler unit ⁽¹⁾ .	See Section 11.2.5.1.2.3.6 .	

- ⁽¹⁾ This module configuration can be optional depending on:
- The video mode configuration selected. See [Figure 11-101](#).
 - The video format and application needs

Figure 11-101. DISPC Video Pipeline Processing Configuration

dispc-089

11.2.5.1.2.3.4 DISPC Subsequence – Configure the VC-1 Range Mapping

This subsequence describes the steps to configure the VC-1 range mapping (see [Table 11-131](#)).

Table 11-131. DISPC Configure the VC-1 Range Mapping

Step	Register/Bit Field/Programming Model	Value
Set the Y component VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y	0x–
Set the Cb and Cr component VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR	0x–
Enable VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE	0x1

11.2.5.1.2.3.5 DISPC Subsequence – Configure the Video Color Space Conversion

This subsequence describes the steps to configure the video color space conversion (see [Table 11-132](#)).

Table 11-132. DISPC Configure the Video Color Space Conversion

Step	Register/Bit Field/Programming Model	Value
Select the range of the color space conversion.	DISPC_VIDp_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients.	DISPC_VIDp_CONV_COEF0[26:16][10:0] RCR, RY	0x–
Set the GY and RCB coefficients.	DISPC_VIDp_CONV_COEF1[26:16][10:0] GY, RCB	0x–
Set the GCb and GCr coefficients.	DISPC_VIDp_CONV_COEF2[26:16][10:0] GCB, GCr	0x–
Set the BCr and BY coefficients.	DISPC_VIDp_CONV_COEF3[26:16][10:0] BCR, BY	0x–
Set the BCb coefficient.	DISPC_VIDp_CONV_COEF4[10:0] BCB	0x–
Enable color space conversion.	DISPC_VIDp_ATTRIBUTES[9] COLORCONVENABLE	0x1

11.2.5.1.2.3.6 DISPC Subsequence – Configure the Video Scaler Unit

This subsequence configures the video scaler unit. [Table 11-133](#) is applicable for RGB pixel format. [Table 11-133](#) and [Table 11-134](#) are applicable for YUV pixel format.

Table 11-133. DISPC Configure the Video Scaler Unit for RGB Pixel Formats or Y Component

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio.	DISPC_VIDp_FIR[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients.	DISPC_VIDp_FIR_COEF_H_i[31:24][23:16][15:8] [7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value.	DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps.	DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS	0x–
Set the vertical resizing ratio.	DISPC_VIDp_FIR[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component.	DISPC_VIDp_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component.	DISPC_VIDp_ACCU_j[26:16] VERTICALACCU	0x–
Enable horizontal and vertical scaler unit.	DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE	0x–

Table 11-134. DISPC Configure the Video Scaler Unit for Cb and Cr Components

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components.	DISPC_VIDp_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components.	DISPC_VIDp_FIR_COEF_H2_i[31:24][23:16][15:8] [7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components.	DISPC_VIDp_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components.	DISPC_VIDp_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components.	DISPC_VIDp_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–

Table 11-134. DISPC Configure the Video Scaler Unit for Cb and Cr Components (continued)

Step	Register/Bit Field/Programming Model	Value
Set the vertical accumulators value for Cb and Cr components.	DISPC_VIDp_ACCU2_[26:16] VERTICALACCU	0x-

Figure 11-102 shows the programming flow of the DISPC scaler unit.

Figure 11-102. DISPC Scaler Unit Programming Flow

11.2.5.1.2.3.7 DISPC Subsequence – Configure the Video Pipeline Layer Output

This subsequence describes the video layer settings available at the pipeline level necessary when using the overlay manager (see Table 11-135).

Table 11-135. DISPC Configure the Video Pipeline Layer Output

Step	Register/Bit Field/Programming Model	Value
Set the LCD/TV output.	DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT	0x-
If DISPC_VIDp_ATTRIBUTES[16] = 0, set the LCD output.	DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2	0x-
Set the Z-order priority of the layer for overlay manager.	DISPC_VIDp_ATTRIBUTES[27:26] ZORDER	0x-
Enable the video pipeline Z-order.	DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE	0x-
Set the Global Alpha value for the alpha blender unit.	DISPC_GLOBAL_ALPHA[31:24][23:16][15:8] VID3GLOBALALPHA, VID2GLOBALALPHA, VID1GLOBALALPHA	0x-

11.2.5.1.2.4 DISPC WB Pipeline Configuration

11.2.5.1.2.4.1 DISPC Main Sequence – Configure the WB Pipeline

This procedure describes the steps to configure the WB pipeline (see Table 11-136).

Table 11-136. DISPC Configure the WB Pipeline

Step	Register/Bit Field/Programming Model	Value
Configure the capture window.	See Table 11-137 .	
Configure the WB scaler unit.	See Table 11-138 .	
Enable truncation logic to match pixel size defined in the format of image DISPC_WB_ATTRIBUTES [4:1] FORMAT.	DISPC_WB_ATTRIBUTES [10] TRUNCATIONENABLE	0x–
If DISPC_WB_ATTRIBUTES [10] !=, configure the WB color space conversion unit.	See Table 11-140 .	
Validate the configuration according to the registers modification.	DISPC_CONTROL2 [6] GOWB	
Enable WB pipeline.	DISPC_WB_ATTRIBUTES [0] ENABLE	0x1

11.2.5.1.2.4.2 DISPC Subsequence – Configure the Capture Window

This subsequence describes the parameters of the image to be captured in the system memory (see [Table 11-137](#)).

Table 11-137. DISPC Configure the Capture Window

Step	Register/Bit Field/Programming Model	Value
Set the input source.	DISPC_WB_ATTRIBUTES [18:16] CHANNELIN	0x–
Select the format of image.	DISPC_WB_ATTRIBUTES [4:1] FORMAT	0x–
Set the X size of image to be captured.	DISPC_WB_SIZE [10:0] SIZEX	0x–
Set the Y size of image to be captured.	DISPC_WB_SIZE [10:0] SIZEY	0x–

11.2.5.1.2.4.3 DISPC Subsequence – Configure the WB Scaler Unit

This subsequence configures the scaler unit. [Table 11-138](#) is applicable for RGB pixel format. [Table 11-138](#) and [Table 11-139](#) are applicable for YUV pixel format.

Table 11-138. DISPC Configure the WB Scaler Unit for RGB Pixel Formats or Y Component

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio.	DISPC_WB_FIR [12:0] FIRHINC	0x–
Set the horizontal FIR coefficients.	DISPC_WB_FIR_COEF_H_j [31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV_j [7:0] FIRHC4	0x–
Set the horizontal accumulators value.	DISPC_WB_ACCU_j [10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps.	DISPC_WB_ATTRIBUTES [21] VERTICALTAPS	0x–
Set the vertical resizing ratio.	DISPC_WB_FIR [28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component.	DISPC_WB_FIR_COEF_HV_j [31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V_j [15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component.	DISPC_WB_ACCU_j [26:16] VERTICALACCU	0x–
Enable horizontal and vertical scaler unit.	DISPC_WB_ATTRIBUTES [6:5] RESIZEENABLE	0x–

Table 11-139. DISPC Configure the WB Scaler Unit for Cb and Cr Components

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components.	DISPC_WB_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components.	DISPC_WB_FIR_COEF_H2_j[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV2_j[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components.	DISPC_WB_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components.	DISPC_WB_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components.	DISPC_WB_FIR_COEF_HV2_j[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V2_j[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components.	DISPC_WB_ACCU2_j[26:16] VERTICALACCU	0x–

11.2.5.1.2.4.4 DISPC Subsequence – Configure the WB Color Space Conversion Unit

This subsequence describes the steps to configure the WB color space conversion unit (see [Table 11-140](#)).

Table 11-140. DISPC Configure the WB Color Space Conversion Unit

Step	Register/Bit Field/Programming Model	Value
Select the range of the color space conversion.	DISPC_WB_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients.	DISPC_WB_CONV_COEF0[26:16][10:0] YG, YR	0x–
Set the GY and RCb coefficients	DISPC_WB_CONV_COEF1[26:16][10:0] CRR, YB	0x–
Set the GCb and GCr coefficients.	DISPC_WB_CONV_COEF2[26:16][10:0] CRB, CRG	0x–
Set the BCr and BY coefficients.	DISPC_WB_CONV_COEF3[26:16][10:0] CBG, CBR	0x–
Set the BCb coefficient.	DISPC_WB_CONV_COEF4[10:0] CBB	0x–
Enable color space conversion.	DISPC_WB_ATTRIBUTES[9] COLORCONVENABLE	0x1

11.2.5.1.2.5 DISPC LCD Output Configuration

11.2.5.1.2.5.1 DISPC Main Sequence – Configure the LCD Output

This procedure details the LCD output configuration (see [Table 11-141](#)).

Table 11-141. DISPC Configure the LCD Output

Step	Register/Bit Field/Programming Model
Configure the LCD overlay manager.	See Table 11-142 .
Configure the gamma table for gamma correction.	See Section 11.2.5.1.2.5.3 .
Configure the CPR.	See Table 11-146 .
Configure the LCD panel timings and parameters.	See Table 11-147 .
Configure BT.656 or BT.1120 mode.	See Table 11-148 .
Validate the LCD output configuration according.	DISPC_CONTROL1[5] GOLCD
	DISPC_CONTROL2[5] GOLCD
Enable LCD output.	DISPC_CONTROL1[0] LCDENABLE

Table 11-141. DISPC Configure the LCD Output (continued)

Step	Register/Bit Field/Programming Model
	DISPC_CONTROL2 [0] LCDENABLE

11.2.5.1.2.5.2 DISPC Subsequence – Configure the Overlay Manager

This subsequence describes the overlay manager settings and transparency color key configuration (see [Table 11-142](#)).

Table 11-142. DISPC Configure the LCD Overlay Manager

Step	Register/Bit Field/Programming Model	Value
Set the LCD panel background color.	DISPC_DEFAULT_COLOR [23:0] DEFAULTCOLOR	0x–
Enable/disable overlay optimization.	DISPC_CONTROL [12] OVERLAYOPTIMIZATION	0x–
Enable the alpha blender.	DISPC_CONFIG1 [18] LCDALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode.	DISPC_CONFIG [11] TCKLCDSELECTION	0x–
Set the transparency color value.	DISPC_TRANS_COLOR [23:0] TRANSCOLORKEY	0x–
Enable transparency color key mode.	DISPC_CONFIG [10] TCKLCDENABLE	0x–

11.2.5.1.2.5.3 DISPC Subsequence – Configure the Gamma Table for Gamma Correction

This subsequence describes the settings for configuring the gamma correction for LCD1, LCD2, and LCD3 (see [Table 11-143](#) through [Table 11-145](#), respectively).

NOTE: Software must ensure there is no visible effect when modifying the table because it is not under hardware control. The synchronization done using the DMA engine inside the DISPC to load the table when it is not used to display the picture on the screen is not present for this mode.

Table 11-143. DISPC Configure the Gamma Table for LCD1

Step	Register/Bit Field/Programming Model	Value
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE0 [31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–
Enable the gamma table.	DISPC_CONFIG1 [3] PALETTEGAMMABLE	0x1
Select the load mode of the gamma look-up table.	DISPC_CONFIG1 [2:1] LOADMODE	0x–

Table 11-144. DISPC Configure the Gamma Table for LCD2

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD2 and TV.	DISPC_CONFIG1 [9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE2 [31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

Table 11-145. DISPC Configure the Gamma Table for LCD3

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD3 and TV.	DISPC_CONFIG3[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE3[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

11.2.5.1.2.5.4 DISPC Subsequence – Configure the Color Phase Rotation

Table 11-146 describes the settings for the CPR unit (see Table 11-146).

Table 11-146. DISPC Configure the Color Phase Rotation

Step	Register/Bit Field/Programming Model	Value
For Color Phase Rotation Processing		
Set the Red coefficients.	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Green coefficients	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–
Set the Blue coefficients.	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Disable the CPR unit in RGB to YUV conversion.	DISPC_CONFIGo[24] COLORCONVENABLE	0x0
Enable the CPR unit.	DISPC_CONFIGo[15] CPR	0x1
For Color Space Conversion Processing		
Set the Y coefficients.	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Cb coefficients.	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–
Set the Cr coefficients.	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Set the CSC range.	DISPC_CONFIGo[25] FULLRANGE	0x–
Enable the CPR unit in RGB to YUV conversion.	DISPC_CONFIGo[24] COLORCONVENABLE	0x1
Disable the CPR unit.	DISPC_CONFIGo[15] CPR	0x0

11.2.5.1.2.5.5 DISPC Subsequence – Configure the LCD Panel Timings and Parameters

This subsequence describes the setting for horizontal and vertical synchronization and signal polarity (see Table 11-147).

Table 11-147. DISPC Configure the LCD Panel Timings and Parameters

Step	Register/Bit Field/Programming Model	Value
Configure spatial/temporal dithering		
Select spatial/temporal number of frames.	DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES	0x–
Enable spatial/temporal dithering.	DISPC_CONTROLo[7] STDITHERENABLE	0x–
Configure AC-bias		
Configure the VSYNC, HSYNC and AC bias polarity.	DISPC_POL_FREQo	0x–
Configure the gating of AC bias polarity.	DISPC_CONFIGo[8] ACBIASGATED	0x–
Configure the AC bias polarity.	DISPC_POL_FREQo[15] IEO	0x–
Set the AC bias frequency.	DISPC_POL_FREQo[7:0] ACB	0x–
Set the number of AC bias transitions per interrupt.	DISPC_POL_FREQo[11:8] ACBI	0x–
Configure the pixel clock		
Set the DISPC logic clock divisor.	DISPC_DIVISORo[23:16] LCD	0x–
Set the pixel clock divisor.	DISPC_DIVISORo[7:0] PCD	0x–
Configure the gating of pixel clock.	DISPC_CONFIGo[5] PIXELCLOCKGATED	0x–
Configure the data		

Table 11-147. DISPC Configure the LCD Panel Timings and Parameters (continued)

Step	Register/Bit Field/Programming Model	Value
Set the pixel clock edge to drive data output.	DISPC_POL_FREQo[14] IPC and CTRL_CORE_SMA_SW_1[DSS_CHx_IPC ⁽¹⁾	0x-
Configure the gating of data output.	DISPC_CONFIGo[4] PIXELDATAGATED	0x-
Set the data output mode.	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x-
Configure the panel parameters		
Set the vertical TV size.	DISPC_SIZE_LCDo[27:16] LPP	0x-
Set the horizontal TV size.	DISPC_SIZE_LCDo[11:0] PPL	0x-
Set the panel type.	DISPC_CONTROLo[3] STNTFT	0x-
Configure the refresh rate and horizontal and vertical parameters		
Set the vertical synchronization timing.	DISPC_TIMING_Vo[31:20][19:8][7:0], VBP, VFP, VSW	0x-
Configure the VSYNC polarity.	DISPC_POL_FREQo[12] IVS	0x-
Configure the gating of VSYNC.	DISPC_CONFIGo[7] VSYNCGATED	0x-
Set the horizontal synchronization timing.	DISPC_TIMING_Ho[31:20][19:8][7:0], HBP, HFP, HSW	0x-
Configure the HSYNC polarity.	DISPC_POL_FREQo[13] IHS	0x-
Configure the gating of HSYNC.	DISPC_CONFIGo[6] HSYNCGATED	0x-
Set the opposition of HSYNC and VSYNC driving.	DISPC_POL_FREQo[17] ONOFF and CTRL_CORE_SMA_SW_1[DSS_CHx_ON_OFF ⁽¹⁾	0x-
If DISPC_POL_FREQo[17] = 1, set the pixel clock edge to drive HSYNC and VSYNC.	DISPC_POL_FREQo[16] RF and CTRL_CORE_SMA_SW_1[DSS_CHx_RF ⁽¹⁾	0x-
Set the alignment of HSYNC and VSYNC.	DISPC_POL_FREQo[18] ALIGN	0x-

⁽¹⁾ The values of the DISPC and Control Module registers must mach

11.2.5.1.2.5.6 DISPC Subsequence – Configure BT.656 or BT.1120 Mode

CAUTION

DISPC supports maximum 256 bytes of horizontal blanking when the LCD outputs are configured in BT modes (bitfield HSW of [DISPC_TIMING_H1/2/3](#) registers is 8 bits wide). This is not compliant with BT.656 and BT.1120 standards, both of which require higher blanking periods. If more than 256 bytes of horizontal blanking are required by the application, then the RGB mode must be used for the LCD outputs.

[Table 11-148](#) lists the steps to configure BT.656 or BT.1120.

Table 11-148. DISPC Configure BT.656 or BT.1120 Mode

Step	Register/Bit Field/Programming Model	Value
Enable BT.656 mode ⁽¹⁾	DISPC_CONFIGo[20] BT656ENABLE	0x1
Enable BT.1120 mode ⁽¹⁾	DISPC_CONFIGo[21] BT1120ENABLE	0x1
Configure the blanking values	See Table 11-149	-
Configure the color phase rotation block	See Table 11-146	-
Disable STALL mode	DISPC_CONTROLo[11] STALLMODE	0x0
Disable TDM	DISPC_CONTROLo[20] TDMENABLE	0x0

⁽¹⁾ It is not possible to enable BT.656 and BT.1120 modes simultaneously on one LCD output.

[Table 11-149](#) lists the blankng values for BT.656 and BT.1120.

Table 11-149. DISPC Configure BT.656 or BT.1120 Blanking Values

Step	Register/Bit Field/Programming Model	Value
For Progressive Mode		
Select progressive mode	DISPC_CONFIG0[22] OUTPUTMODEENABLE	0x0
Set Horizontal blanking	DISPC_TIMING_Ho[7:0] HSW	0x-
Set Vertical frame blanking No 1	DISPC_TIMING_Vo[19:8] VFP	0x-
Set Vertical frame blanking No 2	DISPC_TIMING_Vo[31:20] VBP	0x-
Set Number of lines	DISPC_SIZE_LCD1[27:16] LPP	0x-
Set Number of pixels per line	DISPC_SIZE_LCD1[11:0] PPL	0x-
For Interlaced Mode		
Select interlaced mode	DISPC_CONFIG0[22] OUTPUTMODEENABLE	0x1
Set Horizontal blanking	DISPC_TIMING_Ho[7:0] HSW	0x-
Set Vertical field blanking No 1 for Even Field	DISPC_TIMING_Ho[19:8] HFP	0x-
Set Vertical field blanking No 2 for Even Field	DISPC_TIMING_Ho[31:20] HBP	0x-
Set Vertical field blanking No 1 for Odd Field	DISPC_TIMING_Vo[19:8] VFP	0x-
Set Vertical field blanking No 2 for Odd Field	DISPC_TIMING_Vo[31:20] VBP	0x-
Set Number of lines per field (even)	DISPC_SIZE_LCD1[27:16] LPP	0x-
Set Delta number of odd field compared to even field (in a single line)	DISPC_SIZE_LCD1[15:14] DELTA	0x-
Set Number of pixels per line	DISPC_SIZE_LCD1[11:0] PPL	0x-

11.2.5.1.2.6 DISPC TV Output Configuration

11.2.5.1.2.6.1 DISPC Main Sequence – Configure the TV Output

This procedure describes the TV output configuration (see [Table 11-150](#)).

Table 11-150. DISPC Configure the TV Output

Step	Register/Bit Field/Programming Model
Configure the TV overlay manager.	See Table 11-151 .
Configure the gamma table for gamma correction.	See Table 11-152 .
Configure the TV panel timings and parameters.	See Table 11-153 .
Validate the TV output configuration accordingly.	DISPC_CONTROL1[6] GOTV
Enable the TV output.	DISPC_CONTROL1[1] TVENABLE

11.2.5.1.2.6.1.1 DISPC Subsequence – Configure the TV Overlay Manager

This subsequence describes the overlay manager settings and transparency color key configuration (see [Table 11-151](#)).

Table 11-151. DISPC Configure the TV Overlay Manager

Step	Register/Bit Field/Programming Model	Value
Set the TV panel background color.	DISPC_DEFAULT_COLOR1[23:0] DEFAULTCOLOR	0x-
Enable/disable overlay optimization.	DISPC_CONTROL2[13] TVOVERLAYOPTIMIZATION	0x-
Enable the alpha blender.	DISPC_CONFIG1[19] TVALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode.	DISPC_CONFIG1[13] TCKTVSELECTION	0x-
Set the transparency color value.	DISPC_TRANS_COLOR1[23:0] TRANSCOLORKEY	0x-
Enable transparency color key mode.	DISPC_CONFIG1[10] TCKTVENABLE	0x-

11.2.5.1.2.6.1.2 DISPC Subsequence – Configure the Gamma Table for Gamma Correction

This subsequence describes the steps to configure the gamma table for gamma correction (see [Table 11-152](#)).

NOTE: Software must ensure there is no visible effect when modifying the table because it is not under hardware control. The synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.

Table 11-152. DISPC Configure the Gamma Table for TV Output

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD2 and TV.	DISPC_CONFIG1[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values. For more information, see Section 11.2.4.14.2, Gamma Correction Unit .	DISPC_GAMMA_TABLE2[31][29:20][19:10][9:0] INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

11.2.5.1.2.6.1.3 DISPC Subsequence – Configure the TV Panel Timings and Parameters

This subsequence describes the settings for horizontal and vertical synchronization and signal polarity (see [Table 11-153](#)).

Table 11-153. DISPC Configure the TV Panel Timings and Parameters

Step	Register/Bit Field/Programming Model	Value
Set the hold time for TV data outputs.	DISPC_CONFIG1[19:17]	0x–
Set the vertical TV size.	DISPC_SIZE_TV[27:16] LPP	See Table 11-117
Set the horizontal TV size.	DISPC_SIZE_TV[11:0] PPL	for HD standards.

Table 11-180. DISPC_DEFAULT_COLORo Logical Register Mapping

Hardware Register	Description
DISPC_DEFAULT_COLOR0	Configuration of the background color for LCD1.
DISPC_DEFAULT_COLOR1	Configuration of the background color for TV.
DISPC_DEFAULT_COLOR2	Configuration of the background color for LCD2.
DISPC_DEFAULT_COLOR3	Configuration of the background color for LCD3.

Table 11-181. DISPC_TRANS_COLORo Logical Register Mapping

Hardware Register	Description
DISPC_TRANS_COLOR0	Configuration of the transparency color key for LCD1.
DISPC_TRANS_COLOR1	Configuration of the transparency color key for TV.
DISPC_TRANS_COLOR2	Configuration of the transparency color key for LCD2.

Table 11-181. DISPC_TRANS_COLORo Logical Register Mapping (continued)

Hardware Register	Description
DISPC_DEFAULT_COLOR3	Configuration of the background color for LCD3.

Table 11-182. DISPC_GAMMA_TABLEo Logical Register Mapping

Hardware Register	Description
DISPC_GAMMA_TABLE0	Configuration of the gamma table for LCD1.
DISPC_GAMMA_TABLE1	Configuration of the gamma table for LCD2.
DISPC_GAMMA_TABLE2	Configuration of the gamma table for TV output.
DISPC_GAMMA_TABLE3	Configuration of the gamma table for LCD3.

Table 11-183. DISPC_TIMING_Ho Logical Register Mapping

Hardware Register	Description
DISPC_TIMING_H1	Configuration of the horizontal timing for LCD1.
DISPC_TIMING_H2	Configuration of the horizontal timing for LCD2.
DISPC_TIMING_H3	Configuration of the horizontal timing for LCD3.

Table 11-184. DISPC_TIMING_Vo Logical Register Mapping

Hardware Register	Description
DISPC_TIMING_V1	Configuration of the vertical timing for LCD1.
DISPC_TIMING_V2	Configuration of the vertical timing for LCD2.
DISPC_TIMING_V3	Configuration of the vertical timing for LCD3.

Table 11-185. DISPC_POL_FREQo Logical Register Mapping

Hardware Register	Description
DISPC_POL_FREQ1	Configuration of the output signals for LCD1.
DISPC_POL_FREQ2	Configuration of the output signals for LCD2.
DISPC_POL_FREQ3	Configuration of the output signals for LCD3.

Table 11-186. DISPC_DIVISORo Logical Register Mapping

Hardware Register	Description
DISPC_DIVISOR1	Configuration of the divisors for LCD1.
DISPC_DIVISOR2	Configuration of the divisors for LCD2.
DISPC_DIVISOR3	Configuration of the divisors for LCD3.

Table 11-187. DISPC_SIZE_LCDo Logical Register Mapping

Hardware Register	Description
DISPC_SIZE_LCD1	Configuration of the divisors for LCD1.
DISPC_SIZE_LCD2	Configuration of the divisors for LCD2.
DISPC_SIZE_LCD3	Configuration of the divisors for LCD3.

Table 11-188. DISPC_SIZE Logical Register Mapping

Hardware Register	Description
DISPC_SIZE_LCD1	Configuration of the LCD size on LCD1.
DISPC_SIZE_LCD2	Configuration of the LCD size on LCD2.
DISPC_SIZE_LCD3	Configuration of the LCD size on LCD3.

Table 11-189. DISPC_DATAo_CYCLE1 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE1	Configuration of the output data format for first cycle on LCD1.
DISPC_DATA2_CYCLE1	Configuration of the output data format for first cycle on LCD2.
DISPC_DATA3_CYCLE1	Configuration of the output data format for first cycle on LCD3.

Table 11-190. DISPC_DATAo_CYCLE2 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE2	Configuration of the output data format for second cycle on LCD1.
DISPC_DATA2_CYCLE2	Configuration of the output data format for second cycle on LCD2.
DISPC_DATA3_CYCLE2	Configuration of the output data format for second cycle on LCD3.

Table 11-191. DISPC_DATAo_CYCLE3 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE3	Configuration of the output data format for third cycle on LCD1.
DISPC_DATA2_CYCLE3	Configuration of the output data format for third cycle on LCD2.
DISPC_DATA3_CYCLE3	Configuration of the output data format for third cycle on LCD3.

Table 11-192. DISPC_CPRo_COEF_R Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_R	Configuration of the CPR matrix coefficients for the red component on LCD1.
DISPC_CPR2_COEF_R	Configuration of the CPR matrix coefficients for the red component on LCD2.
DISPC_CPR3_COEF_R	Configuration of the CPR matrix coefficients for the red component on LCD3.

Table 11-193. DISPC_CPRo_COEF_G Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_G	Configuration of the CPR matrix coefficients for the green component on LCD1.
DISPC_CPR2_COEF_G	Configuration of the CPR matrix coefficients for the green component on LCD2.
DISPC_CPR3_COEF_G	Configuration of the CPR matrix coefficients for the green component on LCD3.

Table 11-194. DISPC_CPRo_COEF_B Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD1.
DISPC_CPR2_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD2.
DISPC_CPR3_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD3.

11.2.6.3 DISPC Registers

11.2.6.3.1 DISPC Register Summary

Table 11-195. DISPC Registers Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset	L3_MAIN Physical Address

Table 11-198. DISPC_SYSCONFIG

Address Offset	0x0000 0010		
Physical Address	0x5800 1010	Instance	DISPC
Description	This register allows to control various parameters of the OCP interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MIDLEMODE	RESERVED	CLOCKACTIVITY	RESERVED	WARMRESET	SIDLEMODE	ENWAKEUP	SOFTRESET	AUTOIDLE							

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Write 0s for future compatibility. Reads returns 0.	R	0x00000
13:12	MIDLEMODE	Master interface power management, standby/wait control 0x0: Force-standby. MStandby is only asserted when the module is disabled. MStandby is only asserted when the module is disabled. 0x1: No-Standby: MStandby is never asserted. 0x2: Smart-Standby. MStandby is asserted based on the internal activity of the module. 0x3: Reserved	RW	0x0
11:10	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0

Bits	Field Name	Description	Type	Reset
9:8	CLOCKACTIVITY	Clocks activity during wake up mode period 0x0: OCP and functional clocks can be switched off. 0x1: Functional clocks can be switched off and OCP clocks are maintained during wake up period. 0x2: OCP clocks can be switched off and Functional clocks are maintained during wake up period. 0x3: OCP and functional clocks are maintained during wake-up period.	RW	0x0
7:6	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0
5	WARMRESET	Warm reset. Set this bit to 1 triggers a module warm reset. The bit is automatically reset by the hardware. During reads, it always returns 0. The warm reset keep the configuration registers unchanged. 0x0: Normal mode 0x1: The warm reset is set.	RW	0
4:3	SIDLEMODE	Slave interface power management, Idle req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally. 0x1: No-idle. An idle request is never acknowledged. 0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module. 0x3: Reserved	RW	0x0
2	ENWAKEUP	WakeUp feature control 0x0: Wakeup is disabled. 0x1: Wakeup is enabled.	RW	0
1	SOFTRESET	Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset.	RW	0
0	AUTOIDLE	Internal interface clock gating strategy 0x0: Interface clock is free-running. 0x1: Automatic interface L3_MAIN gating strategy is applied, based on the OCP interface activity. Automatic functional clock gating is also applied to the functional clock based on the module activity (for instance DISPC_<pipe>_ATTRIBUTES.ENABLE).	RW	1

Bits	Field Name	Description	Type	Reset
31	FLIPIMMEDIATEDONE_IRQ	<p>Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
30	FRAMEDONE3_IRQ	<p>Frame done for the third LCD. The third LCD output has been disabled by user. All the data have been sent.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
29	ACBIASCOUNT STATUS3_IRQ	<p>AC bias count status for the third LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
28	VSYNC3_IRQ	<p>Vertical synchronization for the third LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
27	SYNCLOST3_IRQ	<p>Synchronization lost on the third LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the third LCD output.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
26	WBUNCOMPLETE ERROR_IRQ	<p>Write-back DMA buffer is flushed before it is completely drained.</p> <p>In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that case and will trigger every frame</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged</p> <p>0x1: READS: Event is true (Pending) WRITES: Status bit is reset</p>	RW W1toClr	0
25	WBBUFFER OVERFLOW_IRQ	<p>Write-back DMA buffer overflow. The DMA buffer is full.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
24	FRAME DONETV_IRQ	<p>Frame done for the TV. The TV output has been disabled by user. All the data have been sent.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
23	FRAME DONEWB_IRQ	<p>Frame done for the write-back channel. The write-back channel has output the frame. All the data of the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. It is available only when the write-back pipeline transfers back to memory the output of one of the pipelines. In case of overlay capture, the interrupt is not generated and the user shall use the FrameDone for the corresponding captured output.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
22	FRAME DONE2_IRQ	<p>Frame done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
21	ACBIASCOUNT STATUS2_IRQ	<p>AC bias count status for the secondary LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
20	VID3BUFFER UNDERFLOW_IRQ	<p>Video 3 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
19	VID3END WINDOW_IRQ	<p>The end of the video 3 window has been reached. It is detected by the overlay manager when the full video 3 has been displayed.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
18	VSYNC2_IRQ	<p>Vertical synchronization for the secondary LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
17	SYNC LOST2_IRQ	<p>Synchronization lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
16	WAKEUP_IRQ	<p>Wakeup</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
15	SYNCLOST TV_IRQ	Synchronization lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
14	SYNC LOST1_IRQ	Synchronization lost on the primary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the primary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
13	VID2END WINDOW_IRQ	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
12	VID2BUFFER UNDERFLOW_IRQ	Video 2 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
11	VID1END WINDOW_IRQ	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
10	VID1BUFFER UNDERFLOW_IRQ	Video 1 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
9	OCPERROR_IRQ	OCP error. L3_MAIN Interconnect has sent SResp=ERR. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
8	PALETTEGAMMA LOADING_IRQ	Palette Gamma loading status. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. NOTE: CLUT and BITMAP formats are not supported in this family of devices. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
7	GFXEND WINDOW_IRQ	The end of the graphics window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
6	GFXBUFFER UNDERFLOW_IRQ	Graphics DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
5	PROGRAMMED LINENUMBER_IRQ	Programmed line number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
4	ACBIASCOUNT STATUS1_IRQ	AC bias count status for the primary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
3	EVSYNC_ ODD_IRQ	VSYNC for odd field from the TV encoder (HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
2	EVSYNC_ EVEN_IRQ	VSYNC for even field from the TV encoder (HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
1	VSYNC1_IRQ	Vertical synchronization for the primary LCD. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
0	FRAME DONE1_IRQ	Frame done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
31	FLIPI	Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0. 0x0: FrameDone for the primary LCD output is masked 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs	RW	0
30	FRAMEDONE3	Frame done for the third LCD. The third LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the secondary LCD is masked. 0x1: Frame Done for the secondary LCD generates an interrupt when it occurs.	RW	0
29	ACBIAS	AC Bias count status for the third LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs	RW	0
28	VSYNC3	Vertical synchronization for the third LCD 0x0: VSYNC for the secondary LCD output is masked. 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs.	RW	0
27	SYNC	Synchronization lost on the third LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the third LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked. 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs.	RW	0
26	WBUNCOM	The write back buffer has been flushed before been fully drained. Enable. 0x0: Interrupt is masked. 0x1: Interrupt is enabled.	RW	0

Bits	Field Name	Description	Type	Reset
25	WBBUFFER OVERFLOW_EN	Write-back DMA buffer overflow. The DMA buffer is full. 0x0: WBBufferOverflow is masked. 0x1: WBBufferOverflow generates an interrupt when it occurs.	RW	0
24	FRAME DONETV_EN	Frame done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: Frame Done for the TV output is masked. 0x1: Frame Done for the TV output generates an interrupt when it occurs.	RW	0
23	FRAME DONEWB_EN	Frame done for the write-back channel. The write-back channel has output the frame. All the data have been sent for the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. 0x0: Frame done for the write-back is masked. 0x1: Frame done for the write-back generates an interrupt when it occurs.	RW	0
22	FRAME DONE2_EN	Frame done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: Frame done for the secondary LCD is masked. 0x1: Frame done for the secondary LCD generates an interrupt when it occurs.	RW	0
21	ACBIASCOUNT STATUS2_EN	AC Bias count status for the secondary LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked. 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs.	RW	0
20	VID3BUFFER UNDERFLOW_EN	Video 3 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid3BufferUnderflow is masked. 0x1: Vid3BufferUnderflow generates an interrupt when it occurs.	RW	0
19	VID3END WINDOW_EN	The end of the video 3 window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: Vid3EndWindow is masked. 0x1: Vid3EndWindow generates an interrupt when it occurs.	RW	0
18	VSYNC2_EN	Vertical synchronization for the secondary LCD 0x0: VSYNC for the secondary LCD output is masked. 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs.	RW	0
17	SYNC LOST2_EN	Synchronization lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked. 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs.	RW	0
16	WAKEUP_EN	Wake up mask 0x0: WakeUp is masked. 0x1: WakeUp generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
15	SYNC LOSTTV_EN	<p>Synchronization lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output.</p> <p>0x0: Synchronization Lost on the TV output is masked.</p> <p>0x1: Synchronization Lost on the TV output generates an interrupt when it occurs.</p>	RW	0
14	SYNC LOST1_EN	<p>Synchronization lost for the primary LCD</p> <p>0x0: SyncLost for the primary LCD output is masked.</p> <p>0x1: SyncLost for the primary LCD output generates an interrupt when it occurs.</p>	RW	0
13	VID2END WINDOW_EN	<p>The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed.</p> <p>0x0: Vid2EndWindow is masked.</p> <p>0x1: Vid2EndWindow generates an interrupt when it occurs.</p>	RW	0
12	VID2BUFFER UNDERFLOW_EN	<p>Video 2 DMA buffer underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses)</p> <p>0x0: Vid2BufferUnderflow is masked.</p> <p>0x1: Vid2BufferUnderflow generates an interrupt when it occurs.</p>	RW	0
11	ENDVID1 WINDOW_EN	<p>The end of the video 1 window has been reached. It is detected by the overlay manager when the full video 1 has been displayed.</p> <p>0x0: EndVid1Window is masked.</p> <p>0x1: EndVid1Window generates an interrupt when it occurs.</p>	RW	0
10	VID1BUFFER UNDERFLOW_EN	<p>Video 1 DMA buffer underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses)</p> <p>0x0: Vid1bufferunderflow is masked.</p> <p>0x1: Vid1bufferunderflow generates an interrupt when it occurs.</p>	RW	0
9	OCPERROR_EN	<p>OCP Error. L3_MAIN Interconnect has sent SResp=ERR.</p> <p>0x0: OCPErrror is masked.</p> <p>0x1: OCPErrror generates an interrupt when it occurs.</p>	RW	0
8	PALETTE GAMMA_EN	<p>Palette gamma loading mask. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully.</p> <p>NOTE: CLUT and BITMAP formats are not supported in this family of devices.</p> <p>0x0: PaletteGamma is masked.</p> <p>0x1: PaletteGamma generates an interrupt when it occurs.</p>	RW	0
7	GFXEND WINDOW_EN	<p>The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed.</p> <p>0x0: GfxEndWindow is masked.</p> <p>0x1: GfxEndWindow generates an interrupt when it occurs.</p>	RW	0

Bits	Field Name	Description	Type	Reset
6	GFXBUFFER UNDERFLOW_EN	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: GfxBufferUnderflow is masked. 0x1: GfxBufferUnderflow generates an interrupt when it occurs.	RW	0
5	PROGRAMMED LINENUMBER_EN	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: ProgrammedLineNumber is masked. 0x1: ProgrammedLineNumber generates an interrupt when it occurs.	RW	0
4	ACBIASCOUNT STATUS1_EN	AC Bias count status for the primary LCD 0x0: ACBiascountstatus for the primary LCD output is masked. 0x1: ACBiascountstatus for the primary LCD output generates an interrupt when it occurs.	RW	0
3	EVSYNC_ODD_EN	VSYNC for odd field from the TV encoder (HDMI) 0x0: EVSYNC_ODD for the TV output is masked. 0x1: EVSYNC_ODD for the TV output generates an interrupt when it occurs.	RW	0
2	EVSYNC_EVEN_EN	VSYNC for even field from the TV encoder (HDMI) 0x0: EVSYNC_EVEN for the TV output is masked. 0x1: EVSYNC_EVEN for the TV output generates an interrupt when it occurs.	RW	0
1	VSYNC1_EN	Vertical synchronization for the primary LCD. 0x0: VSYNC for the primary LCD output is masked. 0x1: VSYNC for the primary LCD output generates an interrupt when it occurs.	RW	0
0	FRAMEDONE_EN	Frame done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the primary LCD output is masked. 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
31:30	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
29:28	TVINTERLEAVE	TV Interleave Pattern	RW	0x0
27:26	PLCDINTERLEAVE	pLCD Interleave Pattern	RW	0x0
25	FULLRANGE	Color Space Conversion full range setting. wr: VFP start of primary LCD 0x0: Limited range selected. 0x1: Full range selected.	RW	0
24	COLORCONV ENABLE	Enable the color space conversion. It shall be reset when CPR bit field is set to 0x1. wr: VFP start of primary LCD 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
23	FIDFIRST	Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. wr: VFP start of primary LCD 0x0: First field is even. 0x1: Odd field is first.	RW	0
22	OUTPUTMODE ENABLE	Selects between progressive and interlace mode for the primary LCD output. wr: VFP start of primary LCD 0x0: Progressive mode selected. 0x1: Interlace mode selected.	RW	0

Bits	Field Name	Description	Type	Reset
21	BT1120ENABLE	Selects BT.1120 format on the primary LCD output. It is not possible to enable BT.656 and BT.1120 at the same time on the same LCD output. wr: VFP start of primary LCD 0x0: BT.1120 is disabled 0x1: BT.1120 is enabled.	RW	0
20	BT656ENABLE	Selects BT.656 format on the primary LCD output. It is not possible to enable BT.656 and BT.1120 at the same time on the same LCD output. wr: VFP start of primary LCD 0x0: BT.656 is disabled. 0x1: BT.656 is enabled.	RW	0
19	TVALPHABLENDER ENABLE	Selects the alpha blender overlay manager for the TV output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated pipeline connected to the TV output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order =1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: EVSYNC start of primary LCD 0x0: Alpha blender is disabled. 0x1: The alpha blender is enabled.	RW	0
18	LCDALPHABLENDER ENABLE	Selects the alpha blender overlay manager for the primary LCD output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated with the primary LCD output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order =1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: VFP start of primary LCD 0x0: Alpha blender is disabled. The color key alpha blending is used. 0x1: The alpha blender is enabled.	RW	0
17	BUFFERFILLING	Controls if the DMA buffers are refilled only when the LOW threshold is reached or if all DMA buffers are refilled when at least one of them reaches the LOW threshold. wr: immediate 0x0: Each DMA buffer is refilled when it reaches LOW threshold. 0x1: All DMA buffers are refilled up to high threshold when at least one of them reaches the LOW threshold. (only active DMA buffers shall be considered and when reaching the end of the frame the DMA buffer goes to empty condition so no need to fill it again).	RW	0
16	RESERVED	Write 0s for future compatibility. Reads return 0.	RW	0
15	CPR	Color phase rotation control (primary LCD output). It shall be reset when ColorConvEnable bit field is set to 1 wr: VFP start period of primary LCD output 0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled	RW	0

Bits	Field Name	Description	Type	Reset
14	BUFFERMERGE	<p>Buffer merge control wr: EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory or VFP. When enabled, the DISPC_GLOBAL_BUFFER register is ignored. This bit must be set to zero when the write back channel is used. When DISPC_CONTROL2.GOWB is used BUFFERMERGE MUST be zero. When DISPC_CONTROL2.GOWB is used BUFFERMERGE MUST be zero.</p> <p>WR: immediate</p> <p>0x0: DMA buffer merge disabled Each DMA buffer is dedicated to one pipeline.</p> <p>0x1: DMA buffer merge enabled All the DMA buffers are merged into a single one to be used by the single active pipeline.</p>	RW	0
13	TCKTV SELECTION	<p>Transparency color key selection (TV output) wr: EVSYNC</p> <p>0x0: Destination transparency color key selected</p> <p>0x1: Source transparency color key selected</p>	RW	0
12	TCKTVENABLE	<p>Transparency color key enabled (TV output) WR: EVSYNC</p> <p>0x0: Disable the transparency color key for the TV output</p> <p>0x1: Enable the transparency color key for the TV output</p>	RW	0
11	TCKLCD SELECTION	<p>Transparency color key selection (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Destination transparency color key selected</p> <p>0x1: Source transparency color key selected</p>	RW	0
10	TCKLCDENABLE	<p>Transparency color key enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Disable the transparency color key for the LCD</p> <p>0x1: Enable the transparency color key for the LCD</p>	RW	0
9	GAMATABLE ENABLE	<p>For backward compatibility, an enable bit has been added on the 2 additional gamma tables (secondary display and TV). Gamma table of LCD1 is always enabled.</p> <p>0x0: Gamma table LCD2 and TV are bypassed</p> <p>0x1: Gamma table LCD2 and TV are enabled</p>	RW	0
8	ACBIASGATED	<p>ACBias Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: AcBias gated disabled</p> <p>0x1: AcBias gated enabled</p>	RW	0
7	VSYNCGATED	<p>VSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: VSYNC gated disabled</p> <p>0x1: VSYNC gated enabled</p>	RW	0
6	HSYNCGATED	<p>HSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: HSYNC gated disabled</p> <p>0x1: HSYNC gated enabled</p>	RW	0
5	PIXELCLOCK GATED	<p>Pixel Clock Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Pixel clock gated disabled</p> <p>0x1: Pixel clock gated enabled</p>	RW	0

Bits	Field Name	Description	Type	Reset
4	PIXELDATAGATED	Pixel data gated enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel data gated disabled 0x1: Pixel data gated enabled	RW	0
3	PALETTEGAMMA TABLE	Palette/gamma table selection wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the graphics pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory. In case of the table is used as gamma table, it is used for the primary LCD output only. NOTE: CLUT and BITMAP formats are not supported in this family of devices. 0x0: LUT used as palette (only if graphics format is BITMAP1, 2, 4, and 8) 0x1: LUT used as gamma table (only if graphics format is NOT BITMAP1, 2, 4, and 8 or no graphics window present)	RW	0
2:1	LOADMODE	Loading mode for the palette/gamma table wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory 0x0: Palette/Gamma Table and data are loaded every frame 0x1: Palette/Gamma Table to be loaded. The user sets the bit when the palette/gamma table has to be loaded. Hardware resets the bit to 0x2 when table has been loaded. (DISPC_GFX_ATTRIBUTES.ENABLE has to be set to 1). 0x2: Frame data only loaded every frame 0x3: Palette/Gamma Table and frame data loaded on first frame then switch to 0x2 (Hardware).	RW	0x0
0	PIXELGATED	Pixel gated enable (only for TFT) (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel clock always toggles (only in TFT mode) 0x1: Pixel clock only toggles when there is valid data to display. (only in TFT mode)	RW	0

Table 11-242. DISPC_GFX_ATTRIBUTES

Address Offset	0x0000 00A0
Physical Address	0x5800 10A0
Description	The register configures the graphics attributes. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	ANTIFLICKER	RESERVED	RESERVED	SUBSAMPLINGPATTERN	SELFREFRESHAUTO	FORCE1DTILEDMODE	SELFREFRESH	ARBITRATION	ROTATION	BUFPRELOAD	FRAMEPACKINGMODE	NIBBLEMODE	CHANNELOUT	BURSTSIZE	REPLICATIONENABLE	FORMAT	ENABLE										

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. (It does not apply to the palette loading OCP requests using INCR burst only) 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC GFX to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data. 0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	<p>Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value.</p> <p>If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.</p> <p>0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.</p> <p>0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3</p> <p>0x3: Z-order 3: layer above all the other layers</p> <p>0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3</p>	RW	0x0
25	ZORDERENABLE	<p>Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.</p> <p>0x0: Z-order disabled. The Z-order of the layer is 0.</p> <p>0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).</p>	RW	0
24	ANTIFLICKER	<p>Antiflicker filtering using a 3-tap filter with hardcoded coefficients (1/4, 1/2, 1/4)</p> <p>0x0: Antiflicker disabled.</p> <p>0x1: Antiflicker enabled.</p>	RW	0
23:21	RESERVED	<p>Write 0s for future compatibility. Reads return 0.</p>	R	0x0
20:18	SUBSAMPLINGPATTERN	Subsampling pattern setting.	RW	0x0
17	SELFREFRESHAUTO	<p>Automatic self-refresh mode</p> <p>0x0: The transition from Selfrefresh disabled to enabled is controlled by software</p> <p>0x1: The transition from Selfrefresh disabled to enabled is controlled only by hardware</p>	RW	0
16	FORCE1DTILEDMODE	<p>Force TILED regions access to 1D or 2D.</p> <p>0x0: 2D accesses for tiled regions</p> <p>0x1: 1D accesses for tiled regions</p>	RW	0x0
15	SELFREFRESH	<p>Enables the self refresh of the graphics window from its own DMA buffer. This bit should be set only after having set the GO bit of the channel and read back a zero in its field.</p> <p>0x0: The graphics pipeline accesses the interconnect to fetch data from the system memory.</p> <p>0x1: The graphics pipeline does not need anymore to fetch data from memory. Only the graphics DMA buffer is used. It takes effect after the frame has been loaded in the DMA buffer.</p>	RW	0
14	ARBITRATION	<p>Determines the priority of the graphics pipeline. When the graphics pipeline is one of the high priority pipelines. The arbitration wheel gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The graphics pipeline is one of the normal priority pipeline.</p> <p>0x1: The graphics pipeline is one of the high priority pipeline.</p>	RW	0

Bits	Field Name	Description	Type	Reset
13:12	ROTATION	Graphics rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	BUFPRELOAD	Graphics preload value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
10	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0x0
9	NIBBLEMODE	Graphics nibble mode (only for 1-, 2- and 4 bpp) NOTE: BITMAP formats and associated Nibble Mode are not supported in this family of devices. 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled	RW	0
8	CHANNELOUT	Graphics Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
7:6	BURSTSIZE	Graphics DMA burst size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
5	REPLICATIONENABLE	Graphics replication enabled: RGB, ARGB, and RGBA formats are converted into ARGB32-8888 using replication of the MSBs or 0s 0x0: Disable graphics replication logic. The conversion to ARGB32-8888 is done by adding 0s for the LSBs 0x1: Enable graphics replication logic. The conversion to ARGB32-8888 is done by duplicating the MSBs for the LSBs	RW	1

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Graphics format. It defines the pixel format when fetching the graphics picture into memory. 0x6: RGB16-565 0xA: RGBx12-4444 0x7: ARGB16-1555 0xD: RGBA32-8888 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: RGBA12-4444 0x4: xRGB12-4444 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Graphics enable 0x0: Graphics disabled (graphics pipeline inactive and graphics window not present) 0x1: Graphics enabled (graphics pipeline active and graphics window present on the screen)	RW	0

CHANNELOUT2	BURSTTYPE	PREMULTIPHALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE	ROTATION	FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE	FORMAT				ENABLE					

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPHYALPHA	The field configures the DISPC VID1 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data. 0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0

Bits	Field Name	Description	Type	Reset
21	VERTICALTAPS	Video vertical resize tap number. The vertical polyphase filter can be configured in 3-tap or 5-tap configuration. According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap. 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video channel out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color space conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0

Bits	Field Name	Description	Type	Reset
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 1 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Table 11-268. DISPC_VID1_PIXEL_INC

Address Offset	0x0000 00DC	Instance	DISPC
Physical Address	0x5800 10DC		
Description	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see Section 11.2.4.6.5, Predecimation . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

BA																																																																			

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). In case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

Table 11-296. DISPC_VID2_ATTRIBUTES

Address Offset	0x0000 015C	Instance	DISPC
Physical Address	0x5800 115C		
Description	The register configures the attributes of the video window 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE	ROTATION	FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE	FORMAT				ENABLE					

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (must be set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID2 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data. 0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video2 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0

Bits	Field Name	Description	Type	Reset
21	VERTICALTAPS	Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size 0x0: 2 x 128-bit bursts 0x1: 4 x 128-bit bursts 0x3: Reserved 0x2: 8 x 128-bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color space conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable color space conversion YUV to RGB 0x1: Enable color space conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0

Bits	Field Name	Description	Type	Reset
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 2 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	VidEnable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Table 11-302. DISPC_VID2_ROW_INC

Address Offset	0x0000 0168	Instance	DISPC
Physical Address	0x5800 1168		
Description	The register configures the number of bytes to increment at the end of the row for the buffer associated with the video window 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2 .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ROWINC																															

Bits	Field Name	Description	Type	Reset
31:0	ROWINC	Number of bytes to increment at the end of the row Encoded signed value (from $2^{31}1$ to 2^{31}) to specify the number of bytes to increment at the end of the row in the video buffer. The value 0 is invalid. The value 1 means next pixel. The value $1 + n * \text{bpp}$ means increment of n pixels. The value $1 (n + 1) * \text{bpp}$ means decrement of n pixels.	RW	0x0000 0001

Table 11-304. DISPC_VID2_PIXEL_INC

Address Offset	0x0000 016C	Instance	DISPC
Physical Address	0x5800 116C		
Description	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see Section 11.2.4.6.5, Predecimation .The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2 .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Table 11-354. DISPC_VID2_POSITION2

Address Offset	0x0000 0248		
Physical Address	0x5800 1248	Instance	DISPC
Description	The register configures the position of the 2nd video window #2 in FramePacking mode. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2[6] GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								POSY								RESERVED				POSX											

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x00
26:16	POSY	Y position of the 2nd video window #2 Encoded value (from 0 to 2047) to specify the Y position of the video window #2 .The line at the top has the Y-position 0.	RW	0x000
15:11	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x00
10:0	POSX	X position of the 2nd video window #2 Encoded value (from 0 to 2047) to specify the X position of the video window #2. The first pixel on the left of the display screen has the X-position 0.	RW	0x000

Table 11-358. DISPC_VID3_ACCU_j

Address Offset	0x0000 0300 + (0x4 * j)	Index	j = 0 to 1
Physical Address	0x5800 1300 + (0x4 * j)	Instance	DISPC
Description	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the video window 3 (DISPC_VID3_ACCU_0 and DISPC_VID3_ACCU_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for ARGB and Y setting. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). Table 11-360. DISPC_VID3_BA_j

Address Offset	0x0000 0308 + (0x4 * j)	Index	j = 0 to 1
Physical Address	0x5800 1308 + (0x4 * j)	Instance	DISPC
Description	The register configures the base address of the video buffer for the video window 3 (DISPC_VID3_BA_0 and DISPC_VID3_BA_1 for ping-pong mechanism with external trigger, based on the field polarity otherwise only DISPC_VID3_BA_0 is used). Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). In case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

Table 11-368. DISPC_VID3_ATTRIBUTES

Address Offset	0x0000 0370	Instance	DISPC
Physical Address	0x5800 1370		
Description	The register configures the attributes of the video window 3. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCEIDTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE	ROTATION	FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE	FORMAT				ENABLE					

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID3 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data. 0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is used only when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video3 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0

Bits	Field Name	Description	Type	Reset
21	VERTICALTAPS	Video vertical resize tap number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video channel out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size 0x0: 2 x 128-bit bursts 0x1: 4 x 128-bit bursts 0x3: Reserved 0x2: 8 x 128-bit bursts	RW	0x2
13:12	ROTATION	Video rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0

Bits	Field Name	Description	Type	Reset
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video resize enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video format. It defines the pixel format when fetching the video 3 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: RGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Table 11-388. DISPC_VID3_PIXEL_INC

Address Offset	0x0000 0398															
Physical Address	0x5800 1398							Instance	DISPC							
Description	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 3. For more information, see Section 11.2.4.6.5, Predecimation . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Description	The bank of registers configure the down/up/down-scaling coefficients for the vertical resize of the video picture associated with the write back pipeline for the phases from 0 to 7. It is used for ARGB and Y setting. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.

Instance	DISPC
Description	The register configures the attributes of the viwrite back pipeline. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDLENUMBER				IDLESIZE	CAPTUREMODE			ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	WRITEBACKMODE	CHANNELIN			BURSTSIZE	RESERVED	FULLRANGE	TRUNCATIONENABLE	COLORCONVENABLE	BURSTTYPE	ALPHAENABLE	RESIZEENABLE	FORMAT				ENABLE			

Bits	Field Name	Description	Type	Reset
31:28	IDLENUMBER	Determines the number of idles between requests on the L3_MAIN interconnect. It is only used when the write-back pipeline does data transfer from memory to memory. When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit field IDLENUMBER is ignored since a timing generator is used to time the transfer. The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE = 0. The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE = 1 and BURSTSIZE = 2. The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE = 1 and BURSTSIZE = 1. The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE = 1 and BURSTSIZE = 0.	RW	0x0
27	IDLESIZE	Determines if the IDLENUMBER corresponds to a number of bursts or singles. 0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles. 0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles.	RW	0

Bits	Field Name	Description	Type	Reset
26:24	CAPTUREMODE	<p>Defines the frame rate capture.</p> <p>0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x1: Only one frame is captured.</p> <p>0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel.</p> <p>0x2: Only one out of two frames is captured. The first one is captured, and then the second one is skipped, and so on.</p> <p>0x4: Only one out of four frames is captured. The first one is captured, and then the second one is skipped, and so on.</p> <p>0x5: Only one out of five frames is captured. The first one is captured, and then the second one is skipped, and so on.</p> <p>0x3: Only one out of three frames is captured. The first one is captured, and then the second one is skipped, and so on.</p>	RW	0x0
23	ARBITRATION	<p>Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The write-back pipeline is one of the normal priority pipeline.</p> <p>0x1: The write-back pipeline is one of the high priority pipeline.</p>	RW	0
22	DOUBLESTRIDE	<p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p>	RW	0
21	VERTICALTAPS	<p>Video Vertical Resize Tap Number</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p>	RW	0
20	FORCE1DTILEDMODE	<p>Force TILED regions access to 1D or 2D.</p> <p>0x0: 2D accesses for tiled regions</p> <p>0x1: 1D accesses for tiled regions</p>	RW	0x0
19	WRITEBACKMODE	<p>When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel.</p> <p>0x0: Capture mode (default mode)</p> <p>0x1: Memory-to-memory mode</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
18:16	CHANNELIN	Video Channel In configuration WR: immediate 0x6: Video3 pipeline output 0x1: Secondary LCD output 0x0: Primary LCD overlay output 0x2: TV overlay output 0x4: Video1 pipeline output 0x5: Video2 pipeline output 0x3: Graphics pipeline output 0x7: Third LCD output	RW	0x0
15:14	BURSTSIZE	Write-back DMA Burst Size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
13:12	RESERVED	Reserved	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	TRUNCATIONENABLE	It applies only when the input format to the write-back pipeline from the overlay or directly from one of the pipelines is ARGB32. If the format is one of the YUV supported formats, the bit field is ignored. 0x0: Disable truncation logic 0x1: Enable truncation logic from ARGB32 to the pixel format defined in the field FORMAT.	RW	0
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
8	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
7	ALPHAENABLE	Premultiplied alpha enable Read 0x1: Enabled Read 0x0: Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available: 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay. 0x0: The alpha value is not written back.	RW	0

Bits	Field Name	Description	Type	Reset
6:5	RESIZEENABLE	Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Write-back format. It defines the pixel format when storing the write-back picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0

Table 11-452. DISPC_WB_PICTURE_SIZE

Address Offset	0x0000 0594		
Physical Address	0x5800 1594	Instance	DISPC
Description	The register configures the size of the write-back picture associated with the write back pipeline after up/down-scaling. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.

Address Offset	0x0000 07A4 + (0x8 * i)	Index	i = 0 to 7
Physical Address	0x5800 17A4 + (0x8 * i)	Instance	DISPC
Description	<p>The bank of registers configure the down/up/down-scaling coefficients for the vertical and horizontal resize of the video picture associated with the write back pipeline for the phases from 0 to 7. It is used for Crb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.</p>

Table 11-544. DISPC_SIZE_LCD3

Address Offset	0x0000 0834	Instance	DISPC
Physical Address	0x5800 1834		
Description	The register configures the panel size (horizontal and vertical). It is used for the third LCD output. Shadow register, updated on VFP start period of the third LCD. A delta value is used to indicate if the odd field is the same vertical size as the even field or \pm one line.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				LPP								DELTA_LPP	RESERVED	PPL																	

Bits	Field Name	Description	Type	Reset
31:28	RESERVED		R	0x0
27:16	LPP	Lines per panel Encoded value (from 1 to 4096) to specify the number of lines per panel (program to value minus 1).	RW	0x000
15:14	DELTA_LPP	Indicates the delta size value of the odd field compared to the even field 0x0: Same size 0x1: Odd size = even size +1 0x2: Odd size = even size -1	RW	0x0
13:12	RESERVED		R	0x0
11:0	PPL	Pixels per line Encoded value (from 1 to 4096) to specify the number of pixels contained within each line on the display (program to value minus 1). In STALL mode, any value is valid. In non-STALL mode, only values of multiples of 8 pixels are valid.	RW	0x000

Description	The register configures the signal configuration. It is used for the third LCD output. Shadow register, updated on VFP start period of the third LCD		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED													ALIGN	ONOFF	RF	IEO	IPC	IHS	IVS	ACBI					ACB						

Bits	Field Name	Description	Type	Reset
31:19	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0000
18	ALIGN	Defines the alignment between HSYNC and VSYNC assertion 0x0: VSYNC and HSYNC are not aligned. 0x1: VSYNC and HSYNC assertions are aligned.	RW	0
17	ONOFF	HSYNC/VSYNC pixel clock control on/off 0x0: HSYNC and VSYNC are driven on opposite edges of the pixel clock than pixel data. 0x1: HSYNC and VSYNC are driven according to bit 16. Note: Control module register CTRL_CORE_SMA_SW_1[24] DSS_CH2_ON_OFF must be set to match	RW	0
16	RF	Program HSYNC/VSYNC rise or fall 0x0: HSYNC and VSYNC are driven on the falling edge of the pixel clock (if bit 17 is set to 1). 0x1: HSYNC and VSYNC are driven on the rising edge of the pixel clock (if bit 17 is set to 1). Note: Control module register CTRL_CORE_SMA_SW_1[18] DSS_CH2_RF must be set to match	RW	0

Bits	Field Name	Description	Type	Reset
15	IEO	Invert output enable 0x0: Ac-bias is active high (active display mode). 0x1: Ac-bias is active low (active display mode).	RW	0
14	IPC	Invert pixel clock 0x0: Data is driven on the LCD data lines on the rising edge of the pixel clock. 0x1: Data is driven on the LCD data lines on the falling edge of the pixel clock. Note: Control module register CTRL_CORE_SMA_SW_1[21] DSS_CH2_IPC must be set to match	RW	0
13	IHS	Invert HSYNC 0x0: Line clock pin is active high and inactive low. 0x1: Line clock pin is active low and inactive high.	RW	0
12	IVS	Invert VSYNC 0x0: Frame clock pin is active high and inactive low. 0x1: Frame clock pin is active low and inactive high.	RW	0
11:8	ACBI	AC bias pin transitions per interrupt Value (from 0 to 15) used to specify the number of AC bias pin transitions	RW	0x0
7:0	ACB	AC bias pin frequency Value (from 0 to 255) used to specify the number of line clocks to count before transitioning the AC bias pin. This pin is used to periodically invert the polarity of the power supply to prevent DC charge buildup within the display.	RW	0x00

Bits	Field Name	Description	Type	Reset
31:30	SPATIALTEMPORALDITHERINGFRAMES	Spatial/temporal dithering number of frames for the third LCD output wr: VFP start period of the third LCD output 0x0: Spatial only 0x1: Spatial and temporal over two frames 0x3: Reserved 0x2: Spatial and temporal over four frames	RW	0x0
29:27	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
26:25	TDMUNUSEDBITS	State of unused bits (TDM mode only) for the third LCD output wr: VFP start period of the third LCD output 0x0: Low level (0) 0x1: High level (1) 0x3: Reserved 0x2: Unchanged from previous state	RW	0x0
24:23	TDMCYCLEFORMAT	Cycle format (TDM mode only) for the third LCD output wr: VFP start period of third LCD output 0x0: One cycle for 1 pixel 0x1: Two cycles for 1 pixel 0x3: Three cycles for 2 pixels 0x2: Three cycles for 1 pixel	RW	0x0
22:21	TDMPARALLELMODE	Output interface width (TDM mode only) for the third LCD output wr: VFP start period of the third LCD output 0x0: 8-bit parallel output interface selected 0x1: 9-bit parallel output interface selected 0x3: 16-bit parallel output interface selected 0x2: 12-bit parallel output interface selected	RW	0x0

Bits	Field Name	Description	Type	Reset
20	TDMENABLE	Enable the multiple cycle format for the third LCD output wr: VFP start period of third LCD output 0x0: TDM disabled 0x1: TDM enabled	RW	0
19:14	RESERVED	Write 0s for future compatibility. Reads return 0.	RW	0x00
13	RESERVED	Reserved	R	0
12	OVERLAYOPTIMIZATION	Overlay optimization for the third LCD output wr: VFP or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output, or write-back to the memory. 0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them must not be fetched from memory to optimize the bandwidth.	RW	0
11	STALLMODE	STALL mode for the third LCD output wr: VFP start period of the third LCD output 0x0: Normal mode selected 0x1: STALL mode selected. The display controller sends the data without considering the VSYNC/HSYNC. The LCD output is disabled at the end of the transfer of the frame. Software must reenale the LCD output to generate a new frame.	RW	0
10	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
9:8	TFTDATALINES	Number of lines of the third LCD interface wr: VFP start period of the third LCD output 0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface	RW	0x0
7	STDITHERENABLE	Spatial temporal dithering enable for the third LCD output wr: VFP start period of the third LCD output 0x0: Spatial/temporal dithering logic disabled 0x1: Spatial/temporal dithering logic enabled	RW	0
6	RESERVED	Reserved	R	0
5	GOLCD	GO command for the third LCD output. It is used to synchronized the pipelines (graphics and/or video) associated with the third LCD output. wr: Immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is complete. 0x1: The user has finished programming the shadow registers of the pipeline(s) associated with the LCD output, and the hardware can update the internal registers at the VFP start period.	RW	0

Bits	Field Name	Description	Type	Reset
4	M8B	Mono 8-bit mode of the third LCD wr: VFP start period of the third LCD output 0x0: Reserved 0x1: Reserved	RW	0
3	STNTFT	LCD Display type of the third LCD wr: VFP start period of the third LCD output 0x0: Reserved 0x1: Active matrix display operation enabled	RW	0
2	MONOCOLOR	Monochrome/color selection for the third LCD wr: VFP start period of the third LCD output 0x0: Reserved 0x1: Reserved	RW	0
1	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
0	LCDENABLE	Enable the third LCD output wr: Immediate 0x0: LCD output disabled (at the end of the frame when the bit is reset) 0x1: LCD output enabled	RW	0

11.3 High-Definition Multimedia Interface

This section introduces the high-definition multimedia interface (HDMI) module and describes its main functions and connections in the device.

NOTE: All the HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which HDMI features are supported.

11.3.1 HDMI Overview

Figure 11-103 shows an overview of the HDMI module.

Figure 11-103. HDMI Overview

hdmi-001

11.3.1.1 HDMI Main Features

The HDMI module provides the following main features:

- HDMI 1.4a, HDCP 1.4, and DVI 1.0 compliant
 - Includes support for the 3D stereoscopic frame-packing formats of the HDMI v1.4a standard (1080p24Hz, 720p50Hz, 720p60Hz + side-by-side half structure: 1080p60Hz)
- EIA/CEA-861-D video format support (See [Table 11-576](#) for more information.)
- VESA® display monitor timing (DMT) video format support(See [Table 11-577](#) for more information.)
- Support for deep-color mode:
 - 10-bit color component deep-color modes up to 1080p @ 60 Hz
 - 12-bit color component deep-color modes up to 720p/1080i @ 60 Hz
 - 16-bit/component color depth is not supported
- Support for x.v.Color (x.v.Color data from memory outputted by HDMI. No processing, pass-through mode only)
- Supports up to 148.5-MHz pixel clock with deep-color modes (10-bit or 12-bit)
- Supports up to 186 MHz pixel clock with no deep-color mode (8-bit)
- Video formats: 24-bit RGB input
 - ❑ 24/30/36-bit RGB/YCbCr 4:4:4 (deep color) output
 - ❑ 16/20/24-bit YCbCr 4:2:2 output

- Uncompressed multichannel (up to eight channels) audio (L-PCM) support.
- Master inter-integrated circuit (I²C™) interface for display data channel (DDC) connection
- Consumer electronic control (CEC) interface
- Integrated transition minimized differential signaling (TMDS®) and TMDS error reduction coding (TERC4) encoders for data island support
- Integrated TMDS physical layer (PHY) (three TMDS differential data lanes + TMDS differential clock lane)
 - Up to 1.86 Gbps per lane at (1080p @ 60 Hz at 10 bits/component)

11.3.1.2 HDMI Video Formats and Timings

11.3.1.2.1 HDMI CEA-861-D Video Formats and Timings

[Table 11-576](#) presents the video timings supported by the HDMI module, according to the CEA-861-D standard:

Table 11-576. HDMI Video Timings (CEA-861-D)

Refresh Rate	Resolution
24 Hz (Low field rate)	1920 x 1080p
50 Hz	1920 x 1080p
	1920 x 1080i
	2880 x 576p
	2880 x 288p
	1440 x 576p
	1440 x 288p
	1280x720p
59.94 Hz	720 x 576p
	1920 x 1080p
	1920 x 1080i
	1280 x 720p
	2880 x 480p
	2880 x 240p
	1440 x 480p
	1440 x 480i
	1440 x 240p
720 x 480p	
60 Hz	640 x 480p
	1920 x 1080p
	1920 x 1080i
	2880 x 480p
	2880 x 240p
	1280 x 720p
	1440 x 480p
	1440 x 480i
	1440 x 240p
	1280 x 720p
720 x 576p	
200 Hz	720 x 480p
	720 x 576p
239 Hz	720 x 480p

Table 11-576. HDMI Video Timings (CEA-861-D) (continued)

Refresh Rate	Resolution
240 Hz	720 x 480p

11.3.1.2.2 VESA DMT Video Formats and Timings

Table 11-577 lists the video timings supported by the HDMI module and based on the VESA DMT standard:

Table 11-577. HDMI Video timings (VESA DMT)

Refresh Rate	Resolution
60 Hz	640 x 480p
	800 x 600p
	848 x 480p
	1024 x 768p
	1280 x 768p
	1280 x 800p
	1280 x 960p
	1280 x 1024p
	1360 x 768p
	1366 x 768p
	1400 x 1050p
	1440 x 900p
	1680 x 1200p
60 Hz (reduced blanking)	1680 x 1050p
	1920 x 1080p
	1280 x 768p
	1280 x 800p
	1400 x 1050p
1440 x 900p	
1680 x 1050p	
1920 x 1200p	

NOTE: Custom resolutions may work, but are not supported by the device. Using non-standard values can lead to noncompliance with the HDMI interface standard.

3D Graphics Accelerator

This chapter is a basic overview and describes the integration of the 3D graphics processing unit (GPU) subsystem in the device.

NOTE: The GPU subsystem is an instantiation by Texas Instruments of the PowerVR® SGX544 core from Imagination Technologies Limited.

This document contains materials that are © Imagination Technologies Limited.

USSE and PowerVR are trademarks or registered trademarks of Imagination Technologies Limited.

NOTE: This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

Topic	Page
12.1 GPU Overview	2952
12.2 GPU Integration	2954
12.3 GPU Functional Description	2955
12.4 GPU Register Manual	2957

12.1 GPU Overview

NOTE: For AM570x: This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

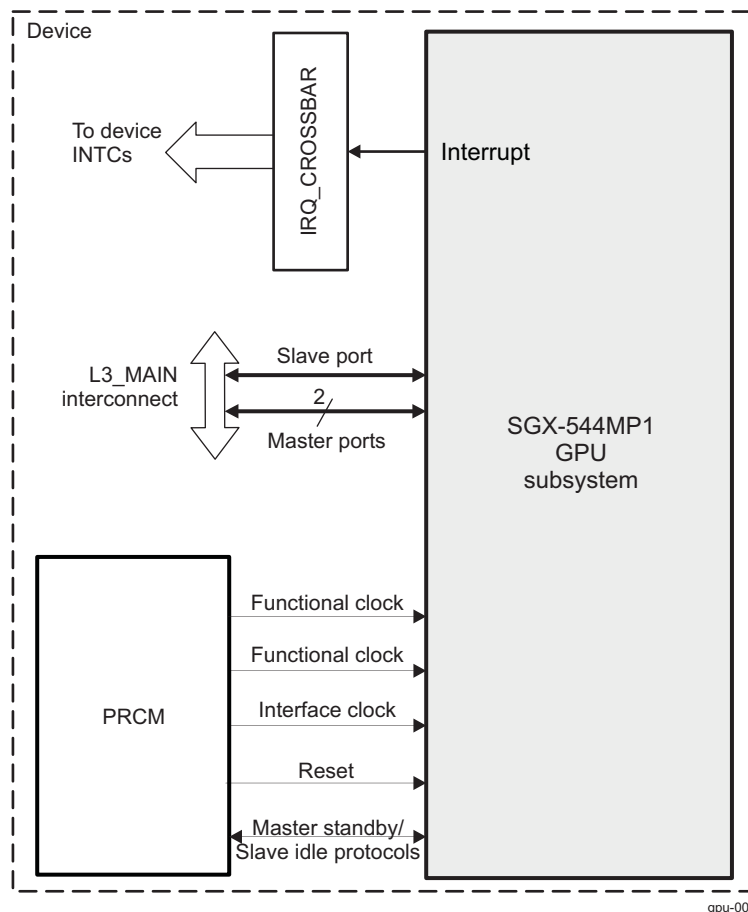

The 3D graphics processing unit (GPU) accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics and compute applications. It is based on the PowerVR® SGX544-MP subsystem from Imagination Technologies Limited.

SGX is a new generation of programmable PowerVR graphics and video processing subsystems. The PowerVR SGX is a scalable architecture which efficiently processes a number of differing multimedia data types concurrently:

- Pixel Data
- Vertex Data
- General Purpose Processing

Figure 12-1 shows the device GPU subsystem.

Figure 12-1. GPU Overview

12.1.1 GPU Features Overview

- API support for industry standards:
 - Direct3D® Feature Level 9.3
- Single-core GPU architecture:
 - 1 x SGX544 core

- System level cache of 64 KiB
- Tile-based deferred rendering architecture:
 - Reduces external bandwidth to SDRAM
- Universal Scalable Shader Engine (USSE™):
 - Multithreaded engine incorporating vertex and pixel shader functionality
 - Automatic load balancing of vertex and pixel processing tasks
- Present and texture load accelerator (PTLA):
 - Enables to move, rotate, twiddle, and scale texture surfaces
 - Supports RGB, ARGB, YUV4:2:2, and YUV4:2:0 surface formats
 - Supports bilinear upscale
 - Supports source color key
- Fully virtualized memory addressing for operating system (OS) in a unified memory architecture:
 - Memory management unit (MMU)
 - Up to 4-GiB virtual address space

The 3D-GPU subsystem generates a single (aggregate) interrupt connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers (see [Section 12.2](#)).

12.1.2 Graphics Feature Overview

- Texture support:
 - Cube map
 - Projected textures
 - Non-square textures
- Texture formats:
 - RGBA 8888, 565, 1555, and 1565
 - Monochromatic 8, 16, 16f, 32f, and 32int
 - Dual channel, 8:8, 16:16, and 16f:16f
 - Compressed textures:
 - PVRTC-i 2 bpp
 - PVRTC-i 4 bpp
 - PVRTC-ii 2 bpp
 - PVRTC-ii 4 bpp
 - ETC1
 - DXT 1-5 and BC 4-5
 - Programmable support for YUV formats:
 - Programmable matrix in hardware, coefficients on 12 bits
 - YUV4:2:2, YUV4:2:0, two planes (NV12 or NV21); YUV4:2:0, three planes
- Resolution support:
 - Frame buffer maximum = 4096 × 4096
 - Texture maximum size = 4096 × 4096
- Texture filtering:
 - Bilinear, trilinear
 - Independent minimum and mag control
- Anti-aliasing:
 - 4× multisampling
 - Programmable sample positions

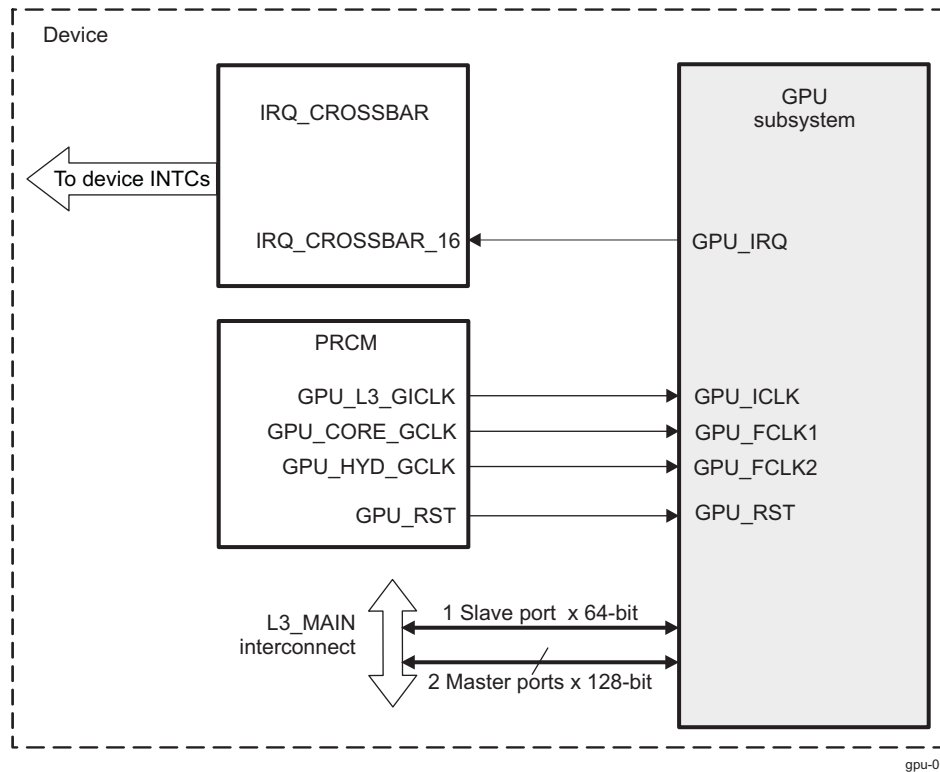

NOTE: TI provides the DXT1-5 and BC4-5 texture compression technology for use only with a Microsoft® Windows® operating system. A separate license is required for the use of this technology (also referred to as S3 texture compression technology) with any other operating system.

12.2 GPU Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 12-2 shows the GPU integration.

Figure 12-2. GPU Integration

gpu-002

The GPU subsystem is connected to the level 3 (L3_MAIN) interconnect by two 128-bit master and a 64-bit slave interfaces.

Table 12-1 through Table 12-3 summarize the integration of the module in the device.

Table 12-1. GPU Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
GPU	PD_GPU	L3_MAIN

Table 12-2. GPU Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPU	GPU_ICLK	GPU_L3_GICLK	PRCM	GPU interface clock

Table 12-2. GPU Clocks and Resets (continued)

	GPU_FCLK1	GPU_CORE_GCLK	PRCM	GPU functional clock of the internal graphic cores
	GPU_FCLK2	GPU_HYD_GCLK	PRCM	GPU functional clock of the internal L2-cache controller and memories
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPU	GPU_RST	GPU_RST	PRCM	GPU non-retention reset signal

Table 12-3. GPU Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
GPU	GPU_IRQ	IRQ_CROSSBAR_16	MPU_IRQ_21 DSP1_IRQ_47	GPU interrupt request mapped to the device Interrupt Crossbar

NOTE: The “Default Mapping” column in [Table 12-3, GPU Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

NOTE: No DMA and no wake-up requests are generated by the GPU subsystem.

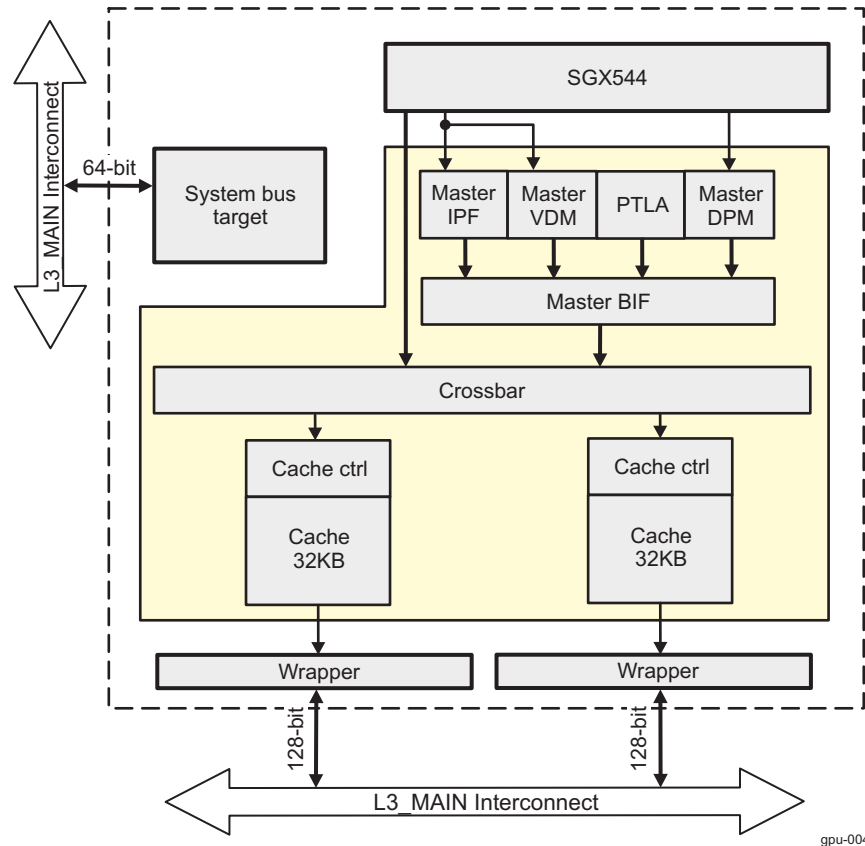

12.3 GPU Functional Description

12.3.1 GPU Block Diagram

The GPU subsystem is based on the PowerVR SGX544-MP1 subsystem. The GPU architecture comprises the following elements:

- SGX544 core
- PTLA
- Cross bar
- System-level cache (SLC)

[Figure 12-3](#) shows the GPU top-level block diagram.

Figure 12-3. GPU Block Diagram

The SGX544-MP1 has 1 × SGX544 core. The crossbar enables SGX544 core to access the SLC. The SLC is a 64-KiB unified multibanked cache with two banks of 32 KiB. The cache line size is 64 bytes. The SGX544 core accesses are interleaved in the different banks.

12.3.2 GPU Clock Configuration

The GPU subsystem operates from three clocks: an interface clock (GPU_ICLK) and two functional clocks (GPU_FCLK1 and GPU_FCLK2). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The GPU_ICLK manages the data transfer on the L3_MAIN master and slave ports.

The GPU_ICLK frequency is selected based on the L3_MAIN interconnect clock frequency of the whole device. For more information about the interface clock, see [Section 3.6.4.11, CD_GPU Clock Domain](#), in the [Chapter 3, Power, Reset, and Clock Management](#).

When no longer required by the GPU subsystem, GPU_ICLK can be disabled by software at the PRCM level. For more information, see [Section 3.7.9, PD_GPU Description](#), in the [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: GPU_ICLK is cut only if the GPU is ready to go into IDLE state.

- GPU_FCLK1 and GPU_FCLK2 are the functional clocks and are used inside the GPU subsystem to generate clock signals to multiple GPU clock domains. The GPU_FCLK1 input supplies clock to the internal graphics core and the GPU_FCLK2 input supplies clock to the shared-cache memories and controllers.

Using the clock source selection and the digital phase-locked loop (DPLL) settings, GPU_FCLK1 and GPU_FCLK2 frequencies can be adjusted.

The GPU_FCLK1 and GPU_FCLK2 clocks are provided by the peripheral DPLL and the core DPLL, as described in [Section 3.6.4.11, CD_GPU Clock Domain](#) in the [Chapter 3, Power, Reset, and Clock](#)

Management. Selection is made at the PRCM level.

When no longer needed by the GPU subsystem, GPU_FCLK1 and GPU_FCLK2 can be cut by software at the PRCM level if the module is ready to enter IDLE state. For more information, see [Section 3.7.9, PD_GPU Description](#) in the [Chapter 3, Power, Reset, and Clock Management](#).

12.3.3 GPU Software Reset

The GPU subsystem has its own reset domain. Global reset of the GPU is performed by activating the GPU_RST signal in the GPU_RST domain.

NOTE: The APIs delivered with the GPU provide a software reset functionally equivalent to a hardware reset.

12.3.4 GPU Power Management

The GPU subsystem has its own power domain (GPU power domain - PD_GPU).

The GPU handles automatic clock gating performed on the multiple internal module clock domains.

In addition, software-controlled clock gating is managed inside the GPU and handled by the related API delivered with the module.

For additional information about the GPU power domain, see [Section 3.7.9, PD_GPU Description](#) in the [Chapter 3, Power, Reset, and Clock Management](#).

12.3.5 GPU Thermal Management

There is a dedicated thermal sensor to monitor operating temperature of the GPU subsystem in the chip. The GPU temperature processing logic is located within the device CTRL_MODULE_CORE and is capable to generate a thermal alert interrupt which can be mapped to all (host) interrupt controllers within the device, via the device IRQ_CROSSBAR. The thermal logic can also generate a thermal shut-down warm reset event to the device PRCM. For further details on the GPU thermal management operation features and register settings, refer to the [Section 18.4.6.2, Thermal Management Related Registers](#) of the [Chapter 18, Control Module](#).

12.3.6 GPU Interrupt Requests

The GPU subsystem can generate one interrupt signal - GPU_IRQ mapped to the IRQ_CROSSBAR_16 input of the device interrupt crossbar.

For more details on programmable configuration of the GPU_IRQ mapping to the different device host interrupt controllers, refer to the [Chapter 18, Control Module](#) and the [Chapter 17, Interrupt Controllers](#).

12.4 GPU Register Manual

CAUTION

All GPU registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

12.4.1 GPU Instance Summary

Table 12-4. GPU Instance Summary

Module Name	Base Address	Size
GPU_WRAPPER	0x5600 FE00	512 bytes

The GPU domain's base address is at 0x5600 0000. GPU address space is 32MiB wide.

12.4.2 GPU Registers

12.4.2.1 GPU_WRAPPER Register Summary
